A-1	Present and Future Estimate of STI Source Usage by Function/Position	41
-----	--	----

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

An early finding of the study was that executives and leaders in industry tend to perceive Scientific and Technical Information as an integral part of the input needed to solve a problem or make a decision. They seldom think of STI as a separate entity. On the other hand, the technologists, specialists and information experts with close working relationships to laboratories and research development activities often view STI as a separate commodity.

There were twelve main categories of sources identified as the primary providers of STI to industry in Canada. 'Experts, colleagues' was the top ranked source followed in descending order of importance by magazines, seminars, conventions and exhibits, libraries, trade associations, research organizations and consultants, government agencies, the company sales force, clients and customers, commercial reference services and finally newspapers which were the lowest ranked as an STI source.

Only two-thirds of the respondents ventured an estimate for the future. There was little if any noticeable change expected within the next five years in the way that STI would be obtained.

Commercial Services
The responses to this survey suggest that there is a high concern that government is not providing STI as desired by business. Businesses also have an important need for confidentiality that can affect the flow of STI. There has not been a major change within the past five years in the priority

of STI as viewed by business. The importance of STI will remain high for the next five years.

The business value of STI is felt to be on a par with investment in plant and equipment and STI can be regarded as an important national resource. The STI systems presently in Canada were judged as inadequate and expected to remain so for the next five years. Canada should develop its own STI system in spite of easy access to foreign STI.

INTRODUCTION

BACKGROUND AND OBJECTIVES

METHODOLOGY

BACKGROUND AND OBJECTIVES

In March 1977, the Ministry of State for Science and Technology commissioned Market Facts of Canada Limited to conduct a survey of the Scientific and Technical Information (STI) needs of Canadian industry. The survey data are intended to provide informed input from industry concerning:

- perceived current and future needs of business for Scientific and Technical Information (STI).
- the role of industry itself and other sectors in filling those needs.
- perceived satisfactions and dissatisfactions with current information sources.

Thus, the major objectives of the study can be summarized as assessing the needs for STI by industry in Canada at the present time, and how these might change in the future. These objectives were also related to each source of STI.

The product of this study would be a 'real world' perception of STI in business terms. A viewpoint was sought which would not be constrained by the language of the information specialist. A benefit of the study would be to help evaluate channel efficiencies and to provide input to help sensitize the information (STI) community to the business users' needs.

This report is an important part of the several components which make

up this study. In addition to this document, the full project will comprise:

- Extensive desk analysis being done by MOSST personnel on the open-end statements which were received with the first questionnaire.
- Additional study information from the discussion groups which have been planned across Canada to allow study participants to react to these findings.

The categories of position title and job functions used in this report required that a wide range of respondent work experience be grouped into a manageable listing.

The titles and functions used in this report are highly specific in identifying Presidents, C.E.O.'s, and Chairmen. The other functions were designated on the basis of the most predominant work experience indicated in the questionnaire.

The administrative category was assigned where work experience was diverse or the technical function was not clearly elaborated.

METHODOLOGY

The survey employed a methodology based on the Delphi method. This involves having 'experts' making forecasts of future events or assessing the likelihood of future occurrences. The collected forecasts are summarized and returned to the 'experts' to allow for a refinement of their estimates. A series of iterations may then take place to develop a forecast consensus. In this study the 'experts' were a cross-section of generalist and specialist executives drawn from Canadian Industry.

In view of the heterogeneous nature of the 'experts' involved in the study, it was decided to undertake a qualitative stage of research before proceeding to the quantitative, Delphi method. A series of in-depth interviews was conducted amongst a broad range of 'experts'.

In summary, the survey actually comprised three stages:

1. In-Depth Interviews
2. A First, Self-Completion Mail-Delivered Questionnaire
3. A Second, Self-Completion Mail-Delivered Questionnaire

A more detailed methodology for each of the stages follows.

1. In-Depth Interviews

This qualitative stage was conducted during April, 1977.

This stage was the preliminary testing of the survey design to ascertain, on a qualitative basis, how best to present the subject of STI. A short list of names of business people was made available by MOSST's project director. The individuals were eminently suitable for their ability to provide insight and frames of reference for use in designing various pilot questionnaires. Respondent occupations and positions ranged from high level policy and decision-making positions in large corporations to persons involved in media and library functions. In each case, the respondents were considered to have responsibilities which required the knowledge of and need for scientific and technical information. These personal interviews were conducted in depth using the following guide:

1. What are primary scientific and technical information needs in the course of work?
2. What major problems occur when seeking STI?
3. How does the 'cost factor' influence use of an information source?
4. What are the primary sources for STI?
5. How these sources are used?
6. How are the sources rated 'qualitatively'?
7. Comments on how the storage of STI relates to inquiries for such information?
8. Types of written or verbal information sources normally used?
9. Names of types, if not mentioned directly; if names mentioned, what are the information sources called?

10. For each name of source, discuss whether or not it is?
 1. Easily available
 2. Too expensive
 3. Easily accessible
 4. Too narrow in scope
 5. Sufficient for your needs
 6. Helped you do your job
11. About each discussed: which sources are of most value; how often is each used?
12. Which sources (by name) are used most often? Why?
13. Why other sources mentioned not used?
14. Last time a source was used:
 - What was the source? If more than one, which was the most important; why?
 - What subject area? Is this a familiar area?
 - What prompted it?
 - Describe how information obtained. Was it readily available? Was route known and open or did it have to be developed?
 - Was the information adequate or not? In what way? Was it general or specific? Was the information presented in a form easily applicable or did it need to be cross-referenced, extrapolated or manipulated in some way?
 - How was it applied? In what work area/task/project? For what kind of organization was the information required? Describe the flow pattern this information would follow once it is received.

The major benefit of these in-depth interviews was to improve the quality and precision of the questionnaire for use in the first quantitative phase of the study.

2. The First, Self-Completion Mail-Delivered Questionnaire

The sample design called for national representation of business establishments within industry groups. MOSST's Project Director arranged to provide professional and trade association membership lists. Within these constraints and where the data were available, Gross Domestic Product by Factor Costs were applied to ensure representation of each category.

SAMPLE DISTRIBUTION

(Table 1-1)

<u>INDUSTRY GROUP</u>	<u>(i)</u> 1975 GDP %	<u>(ii)</u> 1975 Rebalanced %	<u>(iii)</u> Original Sample Design #	<u>(iv)</u> Actual Mail-out #
Communications	2.5	5.3	80	80
Construction	7.5	16.0	240	273
Manufacturing	21.4	45.0	675	675
Mining	4.3	9.0	134	138
Public Utilities	2.7	5.7	86	66
Services (Business Related)	9.0	19.0	285	281
Total	<u>47.4%</u>	<u>100.00%</u>	<u>1500</u>	<u>1513</u>

Similar computations were made by region.

The following trade associations and professional societies were contacted by MOSST's project director to obtain lists and endorsement of the study in principle. (Each name with an asterisk beside it indicates a covering

letter of endorsement was provided.)

- * ASSOCIATION OF CONSULTING ENGINEERS OF CANADA
- * BUSINESS COUNCIL ON NATIONAL ISSUES
- * CANADIAN CONSTRUCTION ASSOCIATION
- * CANADIAN DIRECT MAIL ASSOCIATION
- * CANADIAN GAS ASSOCIATION
- THE CANADIAN INSTITUTE OF CHARTERED ACCOUNTANTS
- * THE CANADIAN INSTITUTE OF MINING AND METALLURGY
- * THE CANADIAN MANUFACTURER'S ASSOCIATION
- * THE CANADIAN MEDICAL ASSOCIATION
- * THE CANADIAN CHEMICAL PRODUCERS ASSOCIATION
- INFORMATICS INSTITUTE OF CANADA
- * PHARMACEUTICAL MANUFACTURERS ASSOCIATION OF CANADA
- * PURCHASING MANAGEMENT ASSOCIATION OF CANADA

The lists were divided by industry groups, and a count by region was done manually. A random selection was then made to conform as closely as possible to the sample frame. Certain lists were used completely, because they were representative of a particular function of the sample, e.g. Business Council on National Issues.

The number of individual questionnaires mailed out and returned by respective industry groups is as follows:

	<u>Mail-out</u>	<u>Return</u>	<u>Return of</u> <u>Mail-out</u>
	#	#	%
Communications	270	45	17
Construction	761	68	9
Manufacturing	1831	214	12
Mining	414	37	9
Public Utilities	198	35	18
Services	507	79	16
Total	<u>3981</u>	<u>478</u>	Avg. % Ret'd <u>12</u>

The first mailout was completed as of the close of business on May 6, 1977.

In order to expedite the turn-around of the questionnaires and to help boost the response rate in this first mail phase of the study, a telephone follow-up was done from 17 through 20 May, 1977. The telephone contacts were primarily in Ontario and in the Toronto area.

The processing of returned questionnaires began on July 15, 1977. It should be noted that since between two and three questionnaires were mailed to each organization in the sample, the proportion of responses in terms of companies is about 22%. This is explained by the fact that in many instances the chief executive officer decided that either he or some other person could speak for the whole organization.

Four hundred and sixty-eight questionnaires, in total, were found to be usable for data processing purposes.

3. The Second, Self-Completion Mail-Delivered Questionnaire

The sample for the second mail-out was based upon the returns received from the first wave of the study. The number of firms included in the second mail-out and returning questionnaires is as follows:

	<u>Mail-out</u>	<u>Returns</u>	<u>% Return</u>
	#	#	%
Total Firms	335	202	60

The number of questionnaires mailed out and returned in the second mail-out is as follows:

	<u>Mail-out</u>	<u>Returns</u>	<u>% Return</u>
	#	#	%
Total Questionnaires	470	276	59

The second mailing commenced the week of July 15, 1977 and ended the week of August 12, 1977. At that date, 276 questionnaires were returned and submitted for processing. An additional 25 questionnaires were received after the cut-off date and forwarded directly to MOSST's project director. Coding, along with keypunching and processing, of the second wave materials were conducted in-house by Market Facts' personnel.

At this point it is worth mentioning that despite the pressure to close out the return mailing in as short a time as possible and despite the time of year, the high response was particularly gratifying.

With both waves of mailing, questionnaires continued to come in after the close-off date, but due to time constraints these have not been included in the analysis presented. However, all have been reviewed and are consistent with the analyzed data.

MAIN FINDINGS

STAGE I - In-Depth Interviews

STAGE II - First Mail Questionnaire

STAGE III- Second Mail Questionnaire

STAGE I

Discussion of the In-Depth Interviews

The in-depth interviews were primarily designed to establish the vocabulary and scope of the first mail questionnaire. Nonetheless, certain findings became clear even from this first qualitative stage and were to be confirmed in the later quantified phases. In particular, it was evidently necessary to establish a commonly understood list of information sources and to determine how these sources are appreciated and regarded by the user. Further, these interviews revealed that STI, and information in general, is regarded most often as an integral part of the business situation. That is, business executives were seen to be using STI continuously, but they seldom thought of it as a separate entity.

STAGE II

Discussion of First Mail Questionnaire

The second stage of the survey was the first use of the self-completion mail-delivered questionnaire in this project. The questionnaire was mailed to prospective respondents selected as described in Section I of this report. The tables following (pages 17 to 30) display the key information which resulted from the first questionnaire.*

The purpose of this first questionnaire was to obtain an overview of existing information sources as they are presently regarded and used by Canadian business.

The term 'Scientific and Technical Information' in the context of this survey was defined as the scope of effort and body of knowledge derived from the natural and physical sciences. However, since the mail survey included many non-technical executives and managers, the context for STI was expanded to include the relationship between scientists, technologists and managers when using or requiring access to STI.

* The tables throughout this report will not always total to 100%, mainly due to rounding or sometimes to multiple mentions. Caution in interpretation is recommended where small bases are indicated.

The respondents to this survey appear to represent a good cross-section of executive functions within industry in Canada. The highest participation in the study of any of the groups was that of the Presidents and Chief Executive Officers. Their response accounted for 18% of the study sample. The second highest response was amongst engineers (17%) with the finance function ranked third with 12% of survey respondents. The majority of participants were university trained. A complete presentation of the response by position title is shown in Table 2-2 (page 18). These appear as competent and knowledgeable persons to comment on the sources and uses of STI in Canada for now and in the future.

The listing of sources in Table 2-1 is a rank order representation of the data reported from the respondents to the first questionnaire. A main objective of this stage of the study was to determine the level of agreement among the respondents for recognizing STI sources. The highest level of agreement in source recognition was 96% for 'experts, colleagues' as STI sources. Magazines were regarded as the second ranking source of STI. (Magazines cited as examples of STI sources ranged from learned journals to popular and trade magazines which are usually found in the Canadian business environment.) Seminars received mention as the third ranking source of STI.

Another objective of this stage of the study was to obtain a measure, in terms of use frequency, of the relevance of the STI sources to business. The Table 2-1 helps to illustrate how the sources are regarded and used as a channel for STI. The frequency of usage of the several STI sources has some interesting patterns.

In terms of frequency of use, the top mention was that suppliers were used by 100% of the respondents at least monthly or more frequently. There was a 93% agreement that suppliers were a source of STI, although suppliers ranked only fifth as a source of STI. Magazines were ranked second in terms of use frequency with 87% of the respondents using magazines at least once per month.

The third most frequently used source was newspapers with 86% of the respondents reporting a use frequency of greater than once per month. A daily use of 57% was reported for newspapers. However, only 64% agreed that newspapers were a source of STI. This is the lowest ranking received by any of the sources in agreement as to the source of STI.

In surveying the data for the top five sources, it is noticeable that government agencies are absent. The government agencies collectively were ranked eighth as a source of STI. The usage of government agencies was ranked as tenth. Thirty-four per cent stated that they used government agencies less than once in three months and 62% use government agencies less than once per month to obtain STI for business.

The agencies most frequently mentioned by the respondents were, in order of mention:

Statistics Canada
Industry Trade and Commerce
National Research Council
Energy, Mines and Resources

A major objective of the first mail questionnaire was to ascertain what change, if any, was to be expected in the next five years in regard to change in use of presently acknowledged STI sources.

The question concerning the expectation about the future changes in use of STI sources witnessed about a one-third drop in respondent participation. Only about two-thirds of the participants made projections to estimate source usage five years from now.

As illustrated in Tables 2-3 through 2-14, there is little, if any, anticipated change expected in the next five years for the use of STI sources.

Other presentations of these data by company size, type of industry, education, etc. were made available to MOSST in EDP output entitled Business Information Survey, Re: Scientific and Technical Information, First Mail-out Data, June 1977.

The first mail questionnaire was quite broad in scope and contained a wide range of statements and questions covering the subject of STI. Some of the questions were not answered in sufficient numbers to provide a valid input for this report. The areas where most respondents did not complete the questionnaire were those which required a narrative or essay response to the statement or question.

TABLE 2-1

PERCENT AGREEMENT ON STI SOURCES AND FREQUENCY OF USE

SOURCES	AGREEMENT		SOURCE USEAGE %			REMARKS
	%	Rank	Monthly or More Often	Rank	Less Than Monthly	
Experts, Colleagues	96	1	78	4	22	35% use daily

STAGE III

Discussion of Second Mail Questionnaire

The third stage of this study was the mailing of the second and final questionnaire. This questionnaire was designed to focus on the primary issues relating to the effective delivery of STI for industry use in Canada.

In this final questionnaire, the respondent was asked to consider STI as a commodity, as well as in terms of delivery systems which provide STI. STI as a commodity was defined as factual material used in the transfer of scientific and practical knowledge through books, tapes, films, etc. An STI system is the means for the transfer of this factual knowledge. An STI system should be able to tell a user where to find the required information; it should be able to deliver the information in the most useful form; and it should respond within the user's time requirements.

When completing the questionnaire, the respondents were asked to give their own personal opinion rather than try to reflect a professional or corporate policy.

The response to the second mail questionnaire presented an interesting contrast of participant agreement and disagreement with the statements proposed. These statements are shown in Table 3-1 (pages 34 to 35).

From these data, there appears to be a consensus that government is not providing STI as desired by business, and that businesses have an important need for confidentiality that can affect the flow of STI. Also, there has not been a major change within the past five years in the priority of STI as viewed by business. The importance of STI will remain high for the next five years. The value of STI is on a par with investment in plant and equipment and STI can be regarded as an important national resource.

Throughout the questionnaire, there was not a strong degree of disagreement with the statements. The highest level of disagreement was with the statement that 'Canada need not emphasize developing its own STI systems', with 10% strongly disagreeing and 62% disagreeing.

Other areas of high disagreement were with the premise that STI systems in Canada were adequate for the present and for the next five years into the future.

A look at the response to the second questionnaire of this survey by geographical region shows a distribution which is usually experienced in surveys of industry in Canada. The provinces of Ontario and Quebec have the most industry and firms and the predominance of response to this survey has come from these locations. The more detailed representation of response by geographical region is shown in Table 3-2.

In Table 3-3, the numbered questions are ranked in order of mean agreement. The main significance of the mean ranking of the statements in

Table 3-3 is to illustrate how the statements relate to one another, rather than how they relate numerically to the mean of 2.5. The highest degree of agreement on the four point scale is 3.22 which was the response to the statement 'STI is not always available from government agencies in a form that business can use'. The lowest measure of mean agreement was for the statement 'Because of easy access to STI from other countries, Canada's need to develop its own systems has a low priority', where the mean response is 2.18.

The portion of the second questionnaire which deals with the responses about the increased flow of STI between sector pairs of the Canadian economy is shown in Table 3-10. Eighty-five per cent of the respondents agreed that the flow of STI should increase from business to education. Seventy-five per cent indicated that the flow of STI should increase between education and business. The lowest level of agreement on where the flow should be increased was between government and education. Only 41% agreed to this notion. However, 28% indicated they either did not know or could not say that this was a good idea.

A complete tabulation of the results from the second questionnaire is in the technical appendix submitted to MOSST's Project Director entitled: Business Information Survey, Re: Scientific and Technical Information, second mail-out data, August 1977.

APPENDIX

A. Use of STI by Function/Position

APPENDIX A

USE OF STI BY FUNCTION/POSITION

The data presented in this report are in fulfillment of the recognized study objectives. However, it is common for a research project to bring into focus additional questions on aspects of the problem under study. In this study, the research has given rise to the interesting question: "What per cent does each source provide of the total STI needed or used by a given function or position?".

Present limitations of time and budget do not allow for continued processing of existing data and additional fieldwork necessary to obtain more precise data to answer this question.

The attempt to estimate an answer to this question using the output data from this work to date (as shown in Tables 2-3 through 2-12) has prompted the formulation of the following algorithm.

$$\text{MEAN SOURCE USE \%} \times \frac{\text{SOURCE RESPONDENT RATE (by position)}}{\text{BASE RESPONSE RATE (by position)}}$$

In order to get comparative data for all 12 sources across all the positions it was necessary to standardize to a base response rate. Each position has its own base response rate. The base response rate is the highest response rate expressed by the position for any source. Therefore, in the

case of presidents' use of libraries, we note that only 50% of the presidents responded by agreeing that libraries are a source of STI. The highest response rate for presidents, CEO's and chairmen is 89% as expressed for seminars and conventions. This 89% is the base percentage for use in the algorithm.

A problem with this method is that it does not allow a numerical comparison between one job type and another except, of course, where the base response rate happens to be the same.

The Tables A-1 and A-1 Continued, in Appendix A, display for each job type the sources in a descending rank order of importance as determined by percentage use.

The data in these tables tend to total to greater than 100% because of the method used. These tables are for general information only, and are enclosed to allow those interested, the opportunity to make a general and very broad estimate of the amount of STI provided by each source.
