December 1993

## NOTE

This tabulation of imports and exports for the calendar year 1992 is organized according to the 1980 Standard Industrial Classification (SIC) codes, at the four-digit level, and by the customs Harmonized System (HS) commodity codes within each SIC industry. The report covers all of the SIC industries in the Chemicals and Chemicals Products major group. The report also includes trade in commodities which are closely related to the chemical products industries, such as rubber products, plastic products, photographic materials, crude oil and natural gas, refined petroleum products and selected materials such as potassium chloride, crude sulphur, chalk and ethyl alcohol. The Chemicals Directorate has provided additional commodity groupings, such as 'inorganic pigments' or 'elastomers' within many of the chemicals four-digit SIC industries to improve comparability with previous Directorate reports.

The tabulations make use of concordance tables prepared by Standards Division, Statistics Canada, which relate HS codes to SIC codes. The concordance tables were made available to the Chemicals Directorate during the summer of 1993. This is the first time that HS-SIC concordances have been used in preparing the **Chemicals Statistical Review**, and there are significant differences in the commodity aggregations shown in previous publications.

Statistics Canada assigned HS codes to SIC industries at the 10-digit level for imports and the 8-digit level for exports. In the case of exports, the assignment was based on the principal products of establishments in the SIC industry, and in some cases production is split between two or more industries. In these instances a weighting factor is used to allocate exports to the respective SIC groups.

In general, the use of HS-SIC concordance tables improves the reliability and consistency of trade statistics by industry, for example, by providing a standard method to determine the value of exports and imports of the chemicals industries. Nevertheless, a number of the HS-SIC assignments have been questioned by industry experts, and discussions to resolve these issues are on-going between the Directorate, industry groups, and Statistics Canada. A further complication in the use of these concordances is that the export HS-SIC concordance is revised each year because of changes in the HS codes (some codes become obsolete and are re-used in a later time period, and new codes are added), whereas the import HS-SIC concordance is a cumulative file, the most recent version of which is used for tabulating import data for all years.
