Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et politiques de Pêches et Océans Canada, notamment la gestion des pêches, la technologie et le développement, les sciences océaniques et l'environnement aquatique, au Canada.

Le titre exact figure au haut du résumé de chaque rapport. Les rapports à l'industrie sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement d'origine dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

ABSTRACT

Barnucz, J., Gáspárdy, R.C., Colm, J.E., and Drake, D.A.R. 2024. Fish community assessment and inventory of SARA-listed fishes in Point Pelee National Park, Ontario, 2021. Can. Data Rep. Fish. Aquat. Sci. 1408: vii + 34 p.

Point Pelee National Park (PPNP) contains several fish species listed under the *Species at Risk Act* (Lake Chubsucker [*Erimyzon succetta*]; Grass Pickerel [*Esox americanus vermiculatus*]; Spotted Gar [*Lepisosteus oculatus*]; Warmouth [*Lepomis gulosus*]; Channel Darter [*Percina copelandi*]), but fish community sampling has occurred infrequently. In August 2021, Fisheries and Oceans Canada conducted fish community sampling in Girardin Pond, Lake Pond, and Redhead Pond to evaluate the composition of the fish community. Fyke net sampling in Girardin and Redhead Pond included 24 net sets across 24 sampling locations with total soak time of 495 hours. Bag seine sampling in Lake Pond included seven sampling locations with total effort of 21 seine hauls. Fyke net catches totaled 333 fishes representing 14 species with Warmouth (n=107), Pumpkinseed (*Lepomis gibbosus*; n=82), young of year *Lepomis* sp. (n=56), Bluegill (*Lepomis macrochirus*, n=52), and Golden Shiner (*Notemigonus crysoleucas*, n=13) being the most abundant species. Bag seine catches totaled 413 fishes representing 14 species with young of year *Lepomis* sp. (n=107), Yellow Perch (*Perca flavescens*, n=91), Tubenose Goby (*Proterorhinus semilunaris*, n=84), Bluegill (n=45) and Largemouth Bass (*Micropterus salmoides*, n=24) being the most abundant species. Altogether, a total of 109 Warmouth, one Spotted Gar, two Grass Pickerel, and two Lake Chubsucker were captured.

RÉSUMÉ

Barnucz, J., Gáspárdy, R.C., Colm, J.E., and Drake, D.A.R. 2024. Fish community assessment and inventory of SARA-listed fishes in Point Pelee National Park, Ontario, 2021. Can. Data Rep. Fish. Aquat. Sci. 1408: vii + 34 p.

Le Parc national de la Pointe-Pelée (PNPP) abrite plusieurs espèces inscrites en vertu de la *Loi sur les espèces en péril* (sucet de lac [*Erimyzon succetta*]; brochet vermiculé [*Esox americanus vermiculatus*]; lépisosté tacheté [*Lepisosteus oculatus*]; crapet sac-à-lait [*Lepomis gulosus*])); et fouille-roche gris [*Percina copelandi*]), mais l'échantillonnage de la communauté de poissons n'a pas été réalisé de manière fréquente. En août 2021, Pêches et Océans Canada a effectué un échantillonnage de la communauté de poissons dans les étangs Girardin, Lake et Redhead afin d'évaluer la composition de la communauté de poissons. L'échantillonnage au verveux dans les étangs Girardin et Redhead comprenait 24 traits de filet dans 24 lieux d'échantillonnage, avec un temps d'immersion total de 495 heures. L'échantillonnage à la senne avec poche dans l'étang Lake comprenait sept sites d'échantillonnage avec un effort total de 21 traits de senne. Les prises au verveux ont totalisé 333 poissons représentant 14 espèces, les espèces les plus abondantes étant le crapet sac-à-lait ($n=107$), le crapet soleil (*Lepomis gibbosus*; $n=82$), des jeunes de l'année des espèces du genre *Lepomis* ($n=56$), le crapet arlequin (*Lepomis macrochirus*, $n=52$), et le méné jaune (*Notemigonus crysoleucas*, $n=13$). Les prises à la senne ont totalisé 413 poissons représentant 14 espèces, les espèces les plus abondantes étant des jeunes de l'année des espèces du genre *Lepomis* ($n=107$), la perche jaune (*Perca flavescens*, $n=91$), le gobie à nez tubulaire (*Proterorhinus semilunaris*, $n=84$), le crapet arlequin ($n=45$) et l'achigan à grande bouche (*Micropterus salmoides*, $n=24$). Au total, 109 crapets sac-à-lait, un lépisosté tacheté, deux brochets vermiculés et deux sucets de lac ont été capturés.

INTRODUCTION

Fisheries and Oceans Canada (DFO) has the responsibility to provide for the protection and recovery of fishes listed under the *Species at Risk Act* of 2002 (SARA). To inform scientific aspects of the recovery process, DFO regularly conducts field sampling to satisfy several research objectives for SARA-listed fishes, such as evaluating the distribution and abundance of species, determining species-habitat relationships, and better understanding the influence of threats and recovery actions. DFO data reports are published to support the Species at Risk Program by providing an overview of field activities and to provide a medium for archiving data associated with the sampling of SARA-listed fishes and their habitat.

Point Pelee National Park (PPNP) contains several fish species listed under the *Species at Risk Act* (Lake Chubsucker [*Erimyzon succetta*]; Grass Pickerel [*Esox americanus vermiculatus*]; Spotted Gar [*Lepisosteus oculatus*]; Warmouth [*Lepomis gulosus*]; Channel Darter [*Percina copelandi*]), but the fish community has been sampled infrequently and without standardized effort over the past several decades. To address this issue, DFO conducted a fish community survey of PPNP in the open waters of Lake Pond, East Cranberry Pond, and West Cranberry Pond in 2019 (Barnucz et al. 2021). In 2021, DFO conducted additional fish community sampling in PPNP within the open waters of Girardin Pond, Redhead Pond, and Lake Pond to further evaluate the composition of the fish community and distribution of SARA-listed species. Although the primary objective of the 2021 sampling was to understand the composition and spatial distribution of the fish community with an emphasis on SARA-listed fishes within focal ponds (Girardin, Redhead, and Lake ponds), the data collected from this work will also help support the development of monitoring protocols for wetland fishes. This data report summarizes findings from the 2021 sampling efforts.

METHODS

FISH COMMUNITY SAMPLING

Fyke Net Sampling

Fyke net sampling in Girardin Pond occurred August 9th through 11th and in Redhead Pond on August 17th and 18th (Table 1a). A total of 12 fyke nets were set in 12 unique site locations (hereafter, ‘sites’) in both Girardin Pond and Redhead Pond (Table 1a, Table 1b, Figure 1). In both Girardin Pond and Redhead Pond, areas that could be effectively fished with fyke nets (water depths < 2 m near the shoreline) were first identified, and then sites were systematically placed around the perimeter of both ponds to provide suitable coverage of the perimeter given the time available for sampling (Figure 1).

Fyke nets had a 0.6 m x 1.2 m box opening followed by 0.6 m diameter hoops attached to a 7.6 m x 0.6 m lead (Figure 2). The entire net was constructed of 3 mm (1/8") mesh, but nets were equipped with a large-mesh (~5 cm) protective screen over the opening of the box to deter turtles from entering the net. Each fyke net had a zipper installed on the top of the box to allow for the easy removal of large fishes and incidental turtle captures, and also allowed for a large float to be inserted to ensure that captured turtles could reach the water’s surface (Larocque et al. 2012). A second zipper was utilized in the funnel of the fyke net to add a second float to enhance turtle recovery and allow for easier removal of turtles from the fyke nets.

The lead and cod of each fyke net were secured using steel rebar. During net deployment, efforts were made to secure the lead to the shore or patches of dense

macrophytes, which encouraged fishes to enter the net (Figure 3). At some sampling sites, water depth (i.e., >1.5 m) and substrate conditions (e.g. too soft) did not allow for full deployment of the net lead and lead length was shortened to properly secure the net. The lead length of each fyke net was recorded at each site. Fyke net wings were not deployed for any sets because water depths at the majority of sites did not allow for effective wing deployment. In Girardin Pond, 1.8 m rebar was used to secure the lead and cod end of all fyke-nets but was subsequently increased to 2.4 m rebar in Redhead Pond to improve net stability. Fyke sampling effort was measured as net soak time in hours. Fyke nets typically fished for a period of approximately 18 to 23 hours depending on travel time and site access to each sampling location. Fyke net catches were emptied into bins with water for processing.

Seine Net Sampling

Seven sites were sampled with a seine net along the east shore of Lake Pond (Table 1c, Figure 1). These sampling locations were fished on August 4th, 16th, and 17th, 2021 (Table 1c). Due to high water levels in Lake Pond, seining sites were selected as areas with water depth < 1.5 m and predominantly sandy substrate; these site attributes allowed staff to effectively pull seine nets while wading. Seining sites were located between the Lake Erie breach and the southeast corner of Lake Pond (Figure 1).

Fishes were sampled with a bag seine, which was 9 m long x 1.8 m tall with a 1.8 m x 1.8 m x 1.8 m bag. The entire seine net was constructed of 3 mm heavy delta mesh. The field crew sampled each site by slowly pulling the seine through the sampling site. Sampling effort was measured as the number of seine hauls per sampling location. Three consecutive seine hauls repeated over the same approximate area were completed at each site and covered approximately 100 m² total. Upon completion, the bag seine was retrieved and captured fishes were removed and placed into bins with fresh water aboard the sampling vessel. Fishes were processed per haul, rather than the aggregate catch per site.

Sample Processing and Identification

Fishes captured in each fyke net or seine haul were identified to species level (where possible), enumerated, and the minimum and maximum total length (TL; mm) of each species was recorded. In addition, individual total lengths (mm) and weights (g) were taken of each captured SARA-listed species. At least one representative specimen of each species at each fyke and seine site was retained as a voucher, either by digital photograph or as a physical voucher. Priority was given to using photo vouchers as a condition of the Parks Canada sampling permits. When required, physical vouchers were preserved in 10% buffered Formalin and species identification was confirmed in the laboratory. All photo and physical vouchers were identified based on Holm et al. (2019a,b) and Holm and Burridge (2019). Because Warmouth and Spotted Gar were tagged in 2019 (Barnucz et al. 2021), these species were evaluated for the presence of PIT tags in 2021 using a Biomark™ 610 pit tag reader. Attention was also given to the occurrence of turtle species in fyke net sets as a sampling permit condition. Turtles captured during fyke net sampling were identified to species and recorded.

HABITAT SAMPLING

For fyke sampling locations, habitat measurements were collected immediately following net deployment. For seining sites, habitat measurements were collected immediately after seining. Three depth measurements (m) were taken at representative depths within the sampling site using a meter stick. Surface water temperature (°C), conductivity (µS), turbidity (NTU), and dissolved oxygen (mg/L) were measured near the centre of the site using a YSI® EXO2 multiparameter sonde. Additional turbidity measurements (m) were collected using a 120

cm Fieldmaster® turbidity tube. Air temperature (°C) was measured using a Kestrel® 3000 pocket wind meter. Site location (latitude, longitude) was determined using a Garmin® Montana 600 handheld GPS unit. The proportion of the site covered by aquatic macrophyte classes (submerged, emergent, floating, and open water) was assessed visually to a total of 100% and the dominant class was recorded. In addition, all macrophytes observed at each site were identified to the lowest taxonomic level possible, and the dominant taxonomic group was recorded. Macrophytes were sampled using two different methods. The first method was a visual assessment of all macrophytes by the field crew. All species observed within the sampling area were identified, to the lowest taxonomic unit (e.g. species) and noted on the field sheet. The second method was using a long handled garden rake to help further identify submerged aquatic vegetation (SAV) species and the SAV density. This rake method was similar to Wagner and Mikulyuk (2012).

SAMPLING PERMITS AND DATA ARCHIVING

Sampling for this project was conducted under Parks Canada Species at Risk Act Authorization Permit PPNP-2019-32658 and Parks Canada Research and Collection Permit Number PP-2019-32658. Fyke netting and seining were conducted under Animal Use Standard Operating Protocol GWACC-115 and GWACC-116, approved by the DFO and Environment and Climate Change Canada Animal Care Committee (operated under approval of the Canadian Council on Animal Care). Data associated with the collections in this report are housed under the project code “2021-PPNP” in the Biodiversity Science database within the Great Lakes Laboratory for Fisheries and Aquatic Sciences. Every effort has been made to ensure the accuracy of data contained in this report; however, results may be updated as part of ongoing data verification procedures. Data associated with this report may be obtained by contacting the Great Lakes Laboratory for Fisheries and Aquatic Sciences.

RESULTS

EFFORT AND FISH COMMUNITY SAMPLING

Fyke Net Sampling – Girardin Pond

Sampling effort in Girardin Pond ranged from 18.35 to 23.23 hours (mean: 20.69 hours) (Table 2). A total of 104 fishes representing 12 species were captured. Based on pooled catch data, the most abundant species were Warmouth ($n=45$), Pumpkinseed (*Lepomis gibbosus*) ($n=20$), young of year *Lepomis* sp. ($n=18$), Bluegill ($n=7$) and Bowfin (*Amia calva*; $n=3$) (Table 4; Figure 4, Appendix 1). No invasive fish species were captured.

Three SARA-listed fish species were captured in Girardin Pond including Warmouth, Lake Chubsucker, and Spotted Gar (Figure 1). A single Lake Chubsucker was captured (Site 9; 32 mm TL) (Table 5a) but was too small to be weighed accurately. A single Spotted Gar was also captured (Site 12; 432 mm TL, 270 g) (Figure 1, Table 5c, Figure 7a). Forty-five Warmouth were captured, representing occurrence at ten of twelve sites (Figure 1, Table 4). Warmouth ranged from 19 – 143 mm TL (mean: 53 mm TL; $n = 45$) and from 5.2 – 54.1 g (mean 16.5 g; $n = 16$) (Table 5d, Figure 8a, Figure 8b).

Fyke Net Sampling – Redhead Pond

Sampling effort in Redhead Pond ranged from 20.10 hours to 21.02 hours (mean: 20.55 hours) (Table 3). A total of 230 fishes representing 11 species were captured. Based on pooled catch data, the most abundant species in Redhead Pond were Warmouth ($n=62$), Pumpkinseed ($n=62$), Bluegill (*Lepomis macrochirus*) ($n=45$), young of year *Lepomis* sp. ($n=38$), and Golden

Shiner (*Notemigonus crysoleucas*; n=11) (Table 4, Figure 5, Appendix 1). No invasive fish species were captured.

Three SARA-listed fish species were captured in Redhead Pond, including Grass Pickerel, Warmouth and Lake Chubsucker (Figure 1). One Lake Chubsucker was captured (Site 24, 44 mm TL, 0.8 g) (Figure 5, Figure 7b, Table 5a), along with two Grass Pickerel (138 and 139 mm TL; 12.3 and 13.6 g, respectively) (Figure 1, Figure 7c, Table 5b). Sixty-two Warmouth were captured, representing occurrence at 11 of 12 sites (Table 5e, Figure 7d). Warmouth ranged from 15 – 175 mm TL (mean: 65 mm TL) and from 0.20 – 123.10 g (mean 13.53 g) (Table 5e, Figure 8a, Figure 8b).

Seine Net Sampling – Lake Pond

Seven sampling locations were surveyed along the east shore of Lake Pond, resulting in a total of 21 seine hauls. A total of 413 fishes representing 14 species were captured. Based on pooled catch data, the most abundant species were young of year *Lepomis* sp. (n=107), Yellow Perch (n=91), Tubenose Goby (*Proterorhinus semilunaris*) (n=84), Bluegill (n=45) and Largemouth Bass (*Micropterus salmoides*; n=24) (Table 4, Figure 6, Appendix 1). Invasive Tubenose Goby (n=84) was captured at six of seven seining sites in Lake Pond and ranged from 31 – 58 mm TL (Table 6, Figure 7e). Invasive Round Goby (n=4) was captured at one site in Lake Pond and ranged from 40 – 63 mm TL (Table 6).

Warmouth was the only SARA-listed fish species captured at seining sites in Lake Pond. Two Warmouth specimens were captured at two sites (Sites 26, 29) (Figure 1, Table 5f). The two Warmouth specimens were 20 mm and 81 mm TL (Table 5f, Figure 8a, Figure 8b). Only one specimen of the two specimens captured were weighed.

None of the captured Warmouth or Spotted Gar in any of the study ponds indicated the presence of a PIT tag.

HABITAT SAMPLING

Aquatic Habitat Assessment – Girardin Pond

Habitat sampling was completed at all 12 sites in Girardin Pond. Water temperature ranged from 20.49 – 28.50 °C (mean: 24.13 °C) (Table 7a). Conductivity ranged from 233.6 – 308.2 µS (mean: 255.7 µS) (Table 7a). Dissolved oxygen ranged from 0.33 – 13.82 mg/L (mean: 5.67 mg/L) (Table 7a). The pH ranged from 7.10 – 8.69 (mean: 7.71) (Table 7a). Turbidity tube ranged from 0.63 – 1.25 m (mean: 1.13 m) (Table 7a). Turbidity ranged from 0.82 – 10.66 NTU (mean: 5.04 NTU) (Table 7a). The mean site depth ranged from 0.78 – 1.45 m with a grand mean of 1.14 m (Table 7a). Air temperature ranged from 24.9 – 33.2 °C (mean: 28.0 °C) (Table 7a).

At the 12 sites sampled in Girardin Pond, the emergent macrophyte cover ranged from 0 – 20% (mean: 7%); floating cover ranged from 5 – 45% (mean: 20%); submerged cover ranged from 45 – 90% (mean: 71%); and open water ranged from 0 – 10% (mean: 2%) (Table 8a). The most common dominant macrophyte class observed across all sites was submerged (12 sites) (Table 8a). The most common aquatic macrophyte genera observed in Girardin Pond were *Ceratophyllum* sp. (12 sites), *Brasenia* sp. (10 sites), *Heteranthera* sp. (10 sites), *Elodea* sp. (8 sites) and *Nuphar* sp. (8 sites) (Table 9, Figure 9). All macrophyte data is summarized in Appendix 2.

Aquatic Habitat Assessment – Redhead Pond

Habitat sampling was completed at all 12 sites in Redhead Pond. Water temperature ranged from 22.70 – 26.40 °C (mean: 24.31 °C) (Table 7b). Conductivity ranged from 270.0 – 335.8 µS (mean: 305.0 µS) (Table 7b). Dissolved oxygen ranged from 2.25 – 10.04 mg/L (mean: 5.44 mg/L) (Table 7b). The pH ranged from 7.53 – 8.53 (mean: 7.86) (Table 7b). Turbidity tube ranged from 0.88 – 1.25 m (mean: 1.1 m) (Table 7b). Turbidity ranged from 0.71 – 5.55 NTU (mean: 2.72 NTU) (Table 7b). The mean depth ranged from 0.57 – 1.55 m with a grand mean of 1.18 m (Table 7b). Air temperature ranged from 22.8 – 31.1 °C (mean: 26.2 °C) (Table 7b).

At the 12 sites sampled in Redhead Pond, the emergent cover ranged from 0 – 15% (mean: 4%); floating cover ranged from 20 – 50% (mean: 37%); submerged cover ranged from 30 – 80% (mean: 51%); and open water ranged from 0 – 35% (mean: 8%) (Table 8b). The most common dominant macrophyte class observed across all sites was submerged (9 sites) (Table 8b). The most common aquatic macrophyte genera observed in Redhead Pond were *Nuphar* sp. (12 sites), *Elodea* sp. (11 sites), *Ceratophyllum* sp. (10 sites), *Myriophyllum* sp. (10 sites) and *Utricularia* sp. (10 sites) (Table 9, Figure 9). All macrophyte data is summarized in Appendix 2.

Aquatic Habitat Assessment – Lake Pond

Habitat sampling was completed at all 7 sites in Lake Pond. Water temperature ranged from 22.24 – 26.10 °C (mean: 23.29 °C) (Table 7c). Conductivity ranged from 244.4 – 278.9 µS (mean: 254.3 µS) (Table 7c). Dissolved oxygen ranged from 5.75 – 12.58 mg/L (mean: 7.51 mg/L) (Table 7c). The pH ranged from 7.96 – 9.31 (mean: 8.46) (Table 7c). Turbidity tube ranged from 0.84 – 1.25 m (mean: 1.19 m) (Table 7c). Turbidity ranged from 0.84 – 7.86 NTU (mean: 2.66 NTU) (Table 7c). The mean depth ranged from 0.39 – 1.20 m with a grand mean of 0.96 m (Table 7c). Air temperature ranged from 21.7 – 29.9 °C (mean: 24.8 °C) (Table 7c).

At the seven sites sampled in Lake Pond, the emergent macrophyte cover ranged from 0 – 5% (mean: 1%); floating cover ranged from 0 – 10% (mean: 2%); submerged cover ranged from 40 – 90% (mean: 61%); and open water ranged from 10 – 50% (mean: 36%) (Table 8c). The most common dominant macrophyte class observed across all sites was submerged (6 sites) (Table 8c). The most common aquatic macrophyte genera observed in Lake Pond were *Ceratophyllum* sp. (6 sites), *Najas* sp. (6 sites), *Myriophyllum* sp. (5 sites), *Chara* sp. (3 sites) and *Elodea* sp. (3 sites) (Table 9, Figure 9). All macrophyte data is summarized in Appendix 2.

TURTLE DETECTIONS

In 2021, several turtle species were detected during fyke netting. A total of 24 turtles from 3 species were detected across Girardin and Redhead ponds (Table 10; Appendix 3,4). Ten Midland Painted Turtles (*Chrysemys picta marginata*) were captured across three sampling sites in Girardin Pond (Table 10; Appendix 3,4a). Another seven Painted Turtles were captured across four sampling sites in Redhead Pond (Table 10; Appendix 3,4a). One Northern Map Turtle (*Graptemys geographicus*) was captured in Redhead Pond (Table 10; Appendix 3,4b). Seven Eastern Musk Turtles (*Sternotherus odoratus*) were captured in Redhead Pond across four sampling sites (Table 10; Appendix 3,4c).

ACKNOWLEDGEMENTS

We sincerely thank Gwenyth Bourgeois and Megan Hutchings who were involved in field sampling and laboratory identification of fishes, and Karl Lamothe who assisted with project

planning. We acknowledge Parks Canada staff Tarra Degazio, Andrew Laforet, and other PPNP staff who provided assistance with project logistics, permitting and park access. We thank Tarra Degazio and Joshua Stacey for helpful reviews. Funding for this project was provided by Parks Canada and DFO's Species at Risk Program.

Table 9. Frequency of occurrence (total number of sites) of aquatic macrophyte species at sites sampled by fyke net (FN) in Girardin (n=12) and Redhead (n=12) ponds, and by seine net (SN) in Lake Pond (n=7), Point Pelee National Park, 2021.

Scientific name	Common name			
		FN Girardin Pond	SN Redhead Pond	SN Lake Pond
algae sp.	algae sp.	1	0	2
<i>Brasenia schreberi</i>	watershield	10	9	1
<i>Ceratophyllum demersum</i>	coontail	12	10	6
<i>Chara</i> sp.	stonewort sp.	0	2	3
<i>Elodea canadensis</i>	Canadian waterweed	8	11	3
<i>Heteranthera dubia</i>	water star-grass	10	7	2
<i>Limnobium spongia</i>	North American frog-bit	4	5	0
<i>Myriophyllum sibiricum</i>	northern milfoil	0	1	0
<i>Myriophyllum</i> sp.	milfoil sp.	4	10	5
<i>Najas</i> sp.	naiad sp.	0	0	6
<i>Nuphar variegata</i>	yellow pond lily	8	12	2
<i>Nymphaea</i> sp.	water lily sp.	5	8	1
<i>Phragmites</i> sp.	reed sp.	2	1	1
<i>Pontederia cordata</i>	pickerelweed	1	4	0
<i>Potamogeton crispus</i>	curly-leaf pondweed	0	0	1
<i>Potamogeton natans</i>	floating pondweed	3	4	0
<i>Potamogeton</i> sp.	pondweed sp.	0	1	0
<i>Scirpooides</i> sp.	bulrush sp.	1	1	1
<i>Sparganium</i> sp.	bur-reed sp.	0	1	0
<i>Typha</i> sp.	cattail sp.	2	0	0
<i>Utricularia</i> sp.	bladderwort	10	10	5
<i>Vallisneria americana</i>	water celery	0	0	4
<i>Zizania</i> sp.	wild rice	3	0	0
Number of Taxa		16	17	15

Table 10. Summary of turtles captured in fyke nets in Girardin and Redhead ponds, recorded for Point Pelee National Park reporting.

Site number	Waterbody	Eastern Musk Turtle	Northern Map Turtle	Painted Turtle	Total individuals
6	Girardin Pond	0	0	3	3
11	Girardin Pond	0	0	3	3
12	Girardin Pond	0	0	4	4
14	Redhead Pond	0	0	1	1
15	Redhead Pond	0	0	3	3
16	Redhead Pond	1	0	1	2
17	Redhead Pond	0	0	1	1
19	Redhead Pond	2	0	0	2
22	Redhead Pond	2	1	0	3
24	Redhead Pond	2	0	0	2
Total individuals		7	1	16	24
Freq. occurrence		4	1	7	10

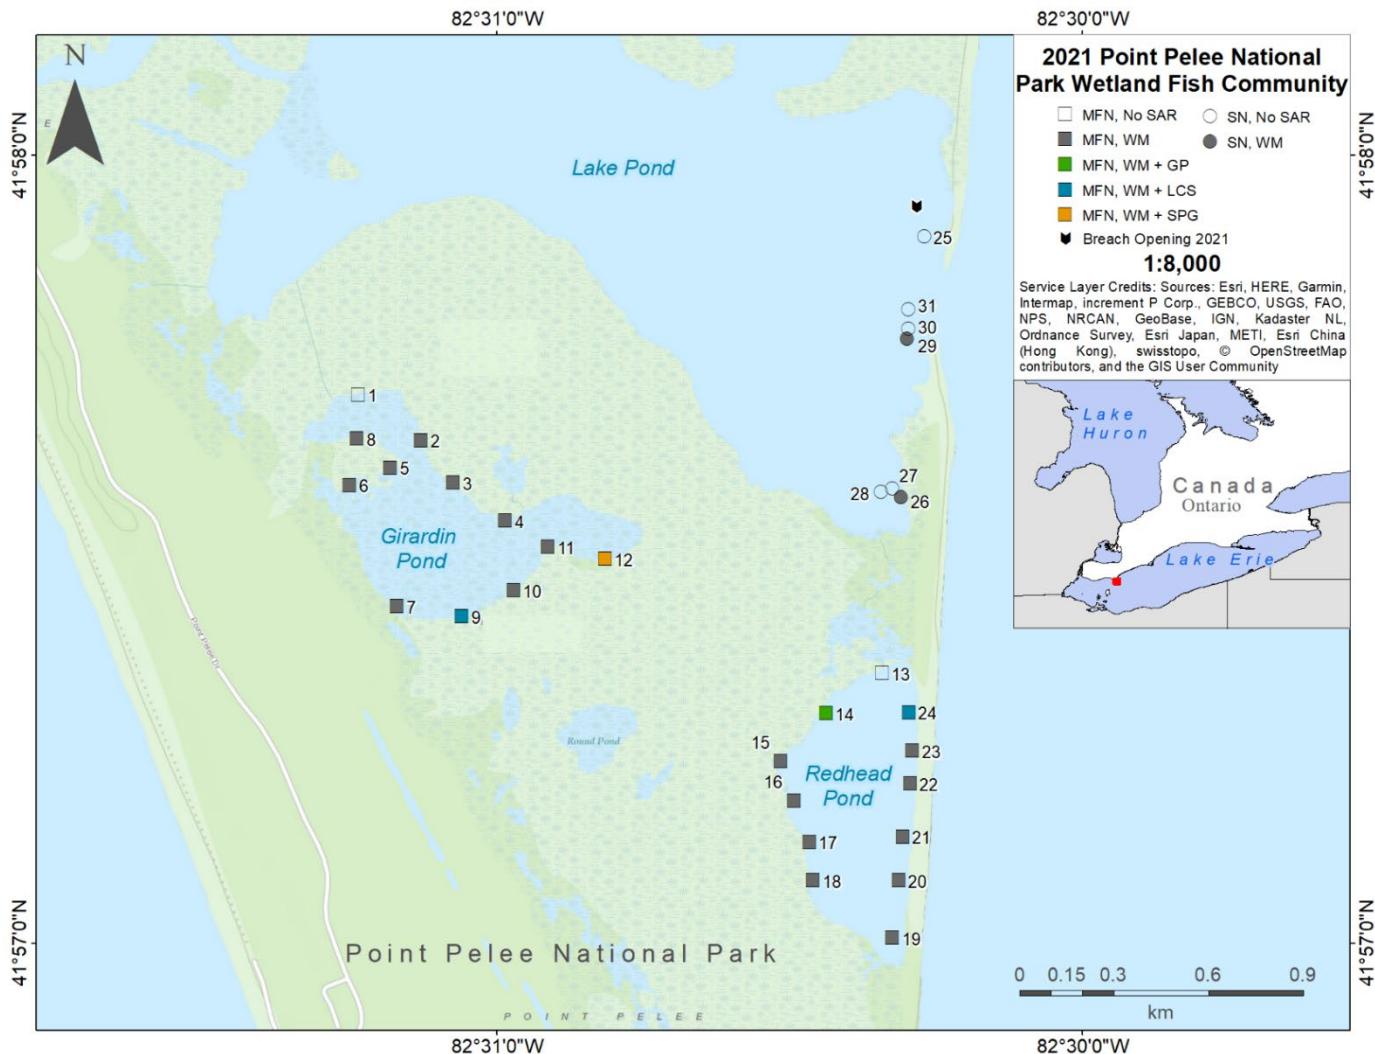

Figure 1. Sampling locations for the 2021 fish community inventory of Point Pelee National Park using seine nets (SN) and mini fyke nets (MFN). Detections of four SARA-listed fish species (SAR) are indicated; Warmouth (WM), Grass Pickerel (GP), Lake Chubsucker (LCS), and Spotted Gar (SPG).

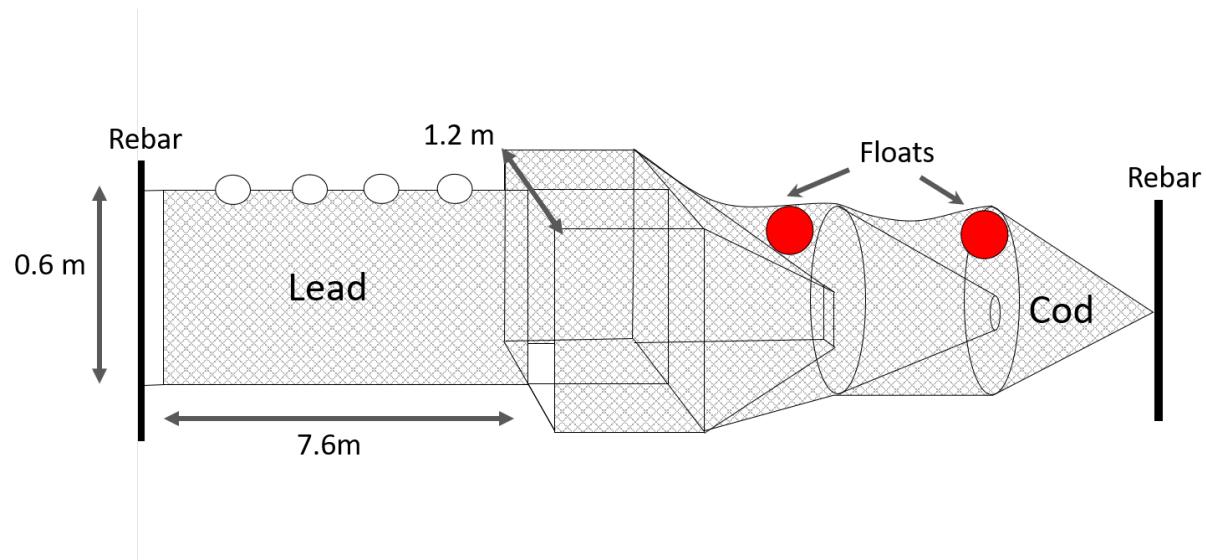

Figure 1. Schematic of fyke net layout for Point Pelee National Park sampling in 2021 (not to scale).

Figure 2. Site picture with fyke net in Redhead Pond, PPNP, 2021 (Site #14)

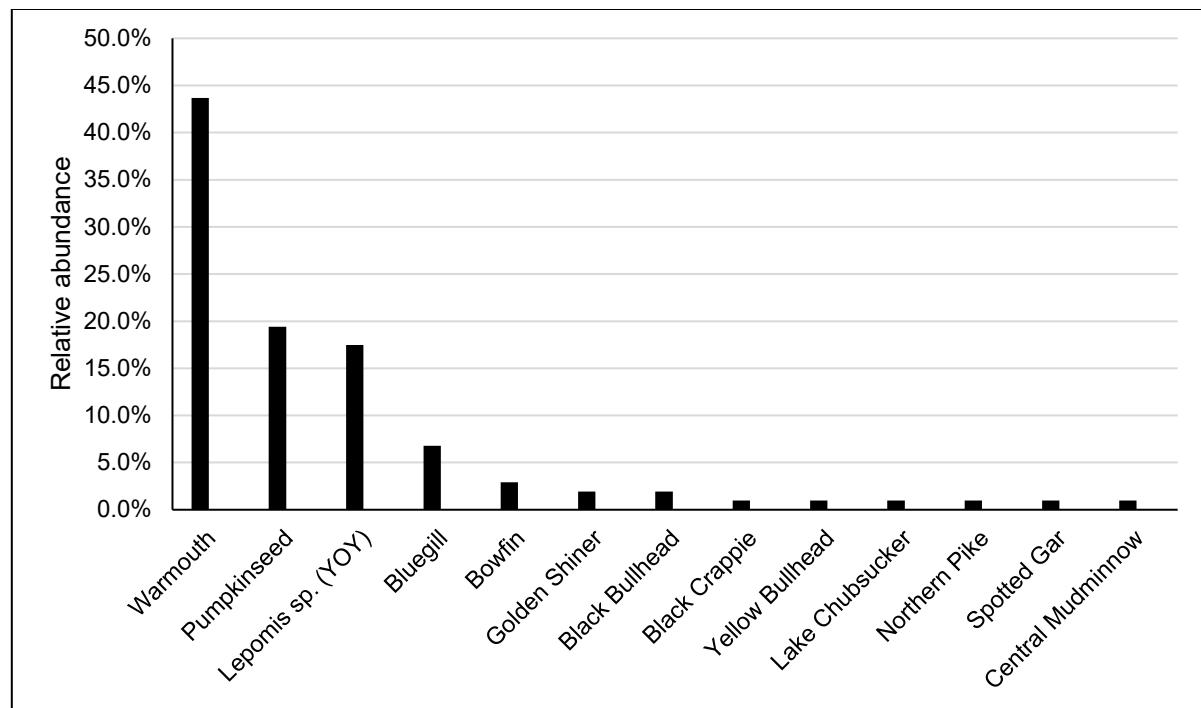

Figure 4 Relative abundance of fishes (pooled raw abundance) captured by fyke nets in Girardin Pond, Point Pelee National Park (2021).

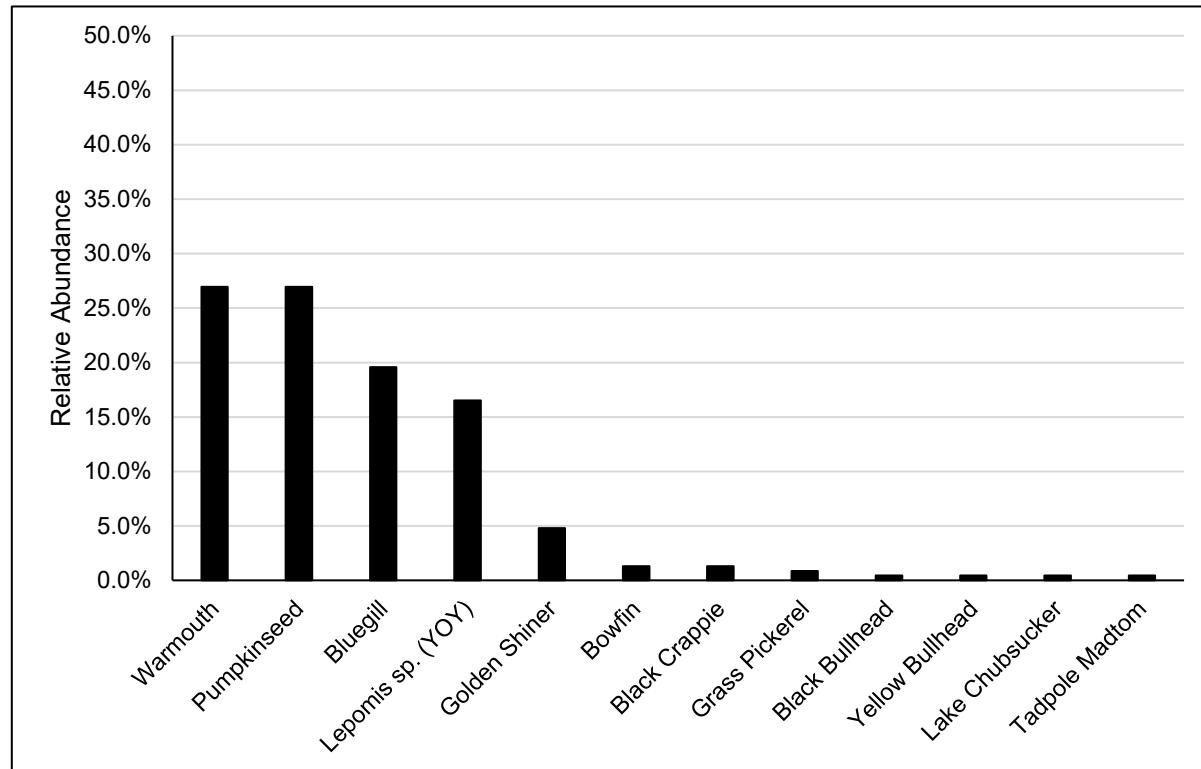

Figure 5 Relative abundance of fishes (pooled raw abundance) captured by fyke nets in Redhead Pond, Point Pelee National Park (2021).

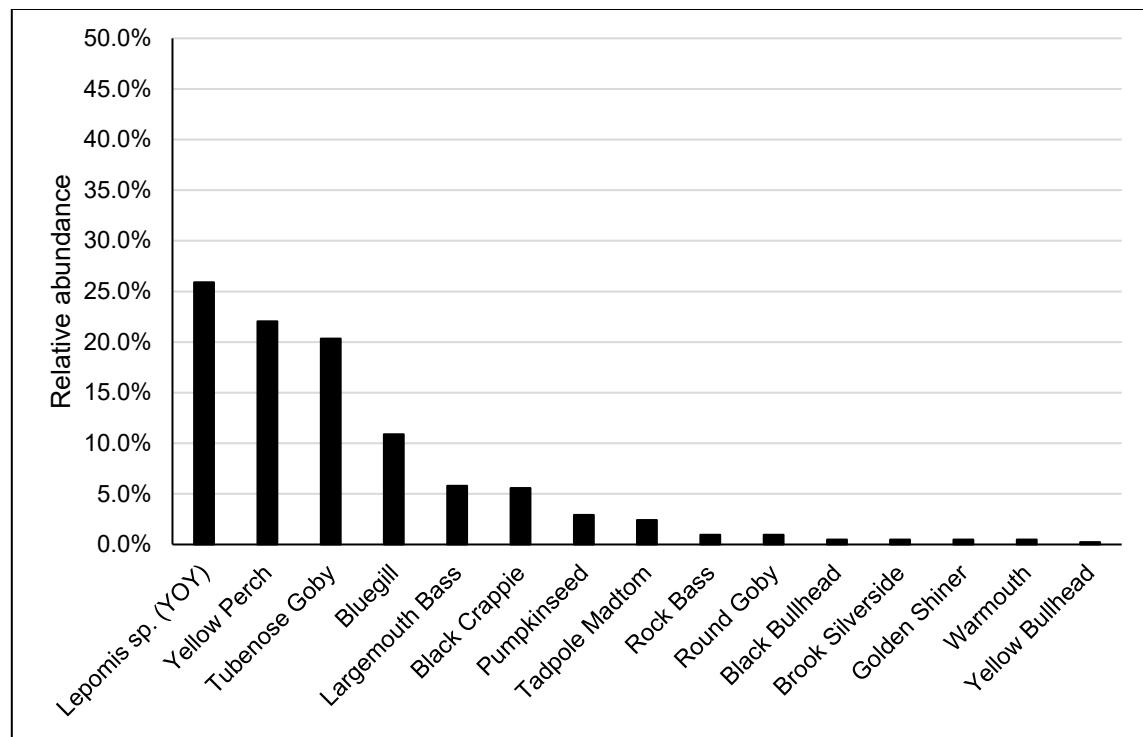

Figure 6. Relative abundance of fishes (pooled raw abundance) captured by seine nets in Lake Pond, Point Pelee National Park (2021).

a) Spotted Gar, 432 mm, site #12, Girardin Pond

b) Lake Chubsucker, 44 mm, site #24, Redhead Pond

c) Grass Pickerel, 138 mm, site #14, Redhead Pond

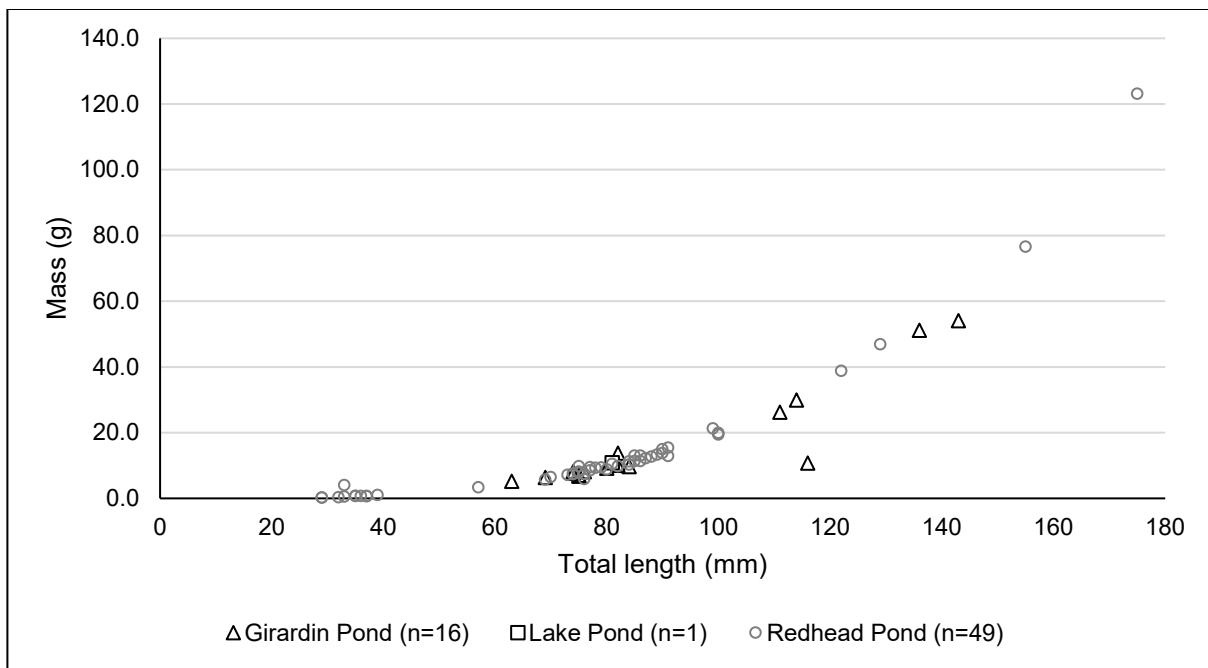

d) Warmouth, 175 mm, site #16, Redhead Pond

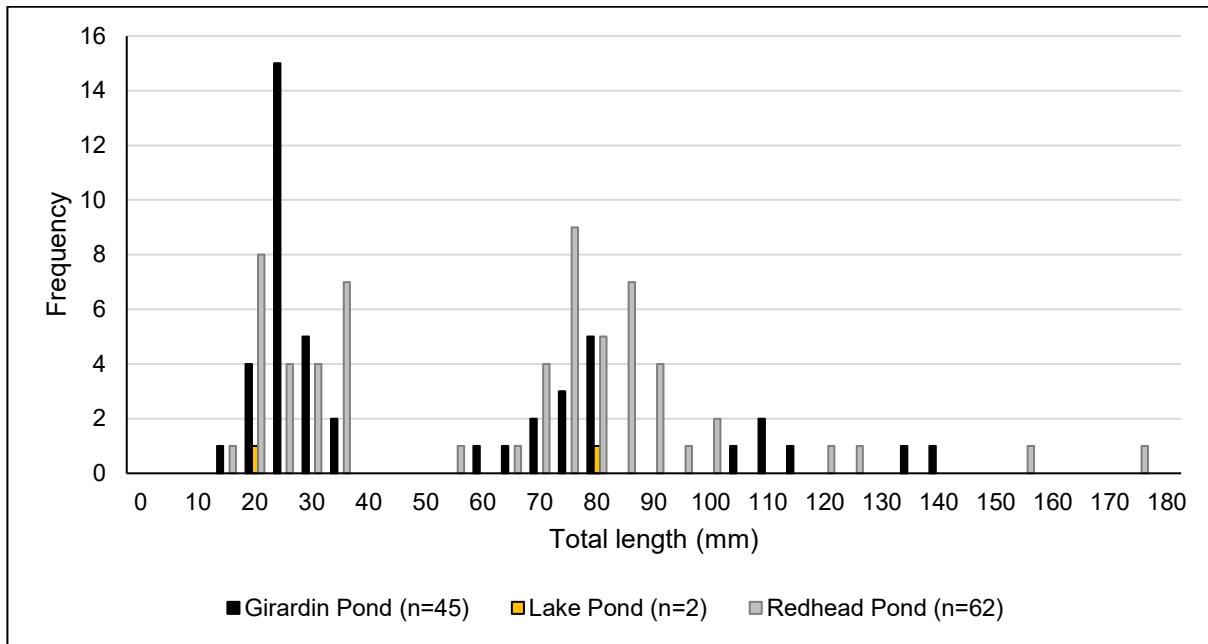

e) Tubenose Goby, 40 mm, site #27, Lake Pond

Figure 7. Voucher photographs of SARA-listed (a – d) and invasive species (e) captured in fyke net sampling in Girardin and Redhead ponds, and in seine net sampling in Lake Pond, Point Pelee National Park, 2021.

a) Length-weight relationship ($n=66$)

b) Length-frequency (bins of 5 mm) ($n=109$)

Figure 8. Warmouth length and weight data: a) length-weight relationship, and b) length-frequency of Warmouth captured in Girardin Pond, Lake Pond, and Redhead Pond in Point Pelee National Park, 2021.

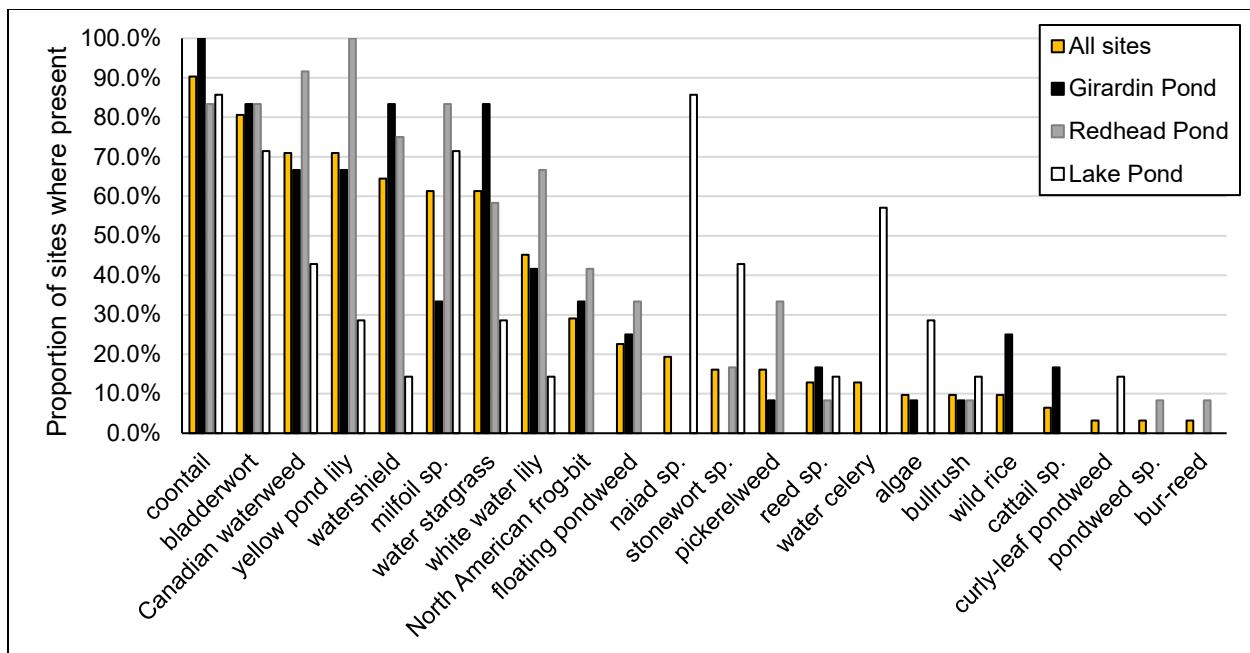

Figure 9. Frequency of occurrence of aquatic macrophytes, as proportion of sites within pond where species was present.

APPENDICES

Appendix 1. Total number of each species captured per fyke net set in a) Girardin Pond and b) Redhead Pond, and per seine haul in c) Lake Pond.
