Operational Research and Analysis

CATEGORIES OF PUBLICATION

ORA Reports are the most authoritative and most carefully considered publications issued. They normally embody the results of major research activities or are significant works of lasting value or provide a comprehensive view on major defence research initiatives. ORA Reports are approved by DGOR and are subject to peer review.

ORA Project Reports record the analysis and results of studies conducted for specific sponsors. This category is the main vehicle to report completed research to the sponsors and may also describe a significant milestone in ongoing work. They are approved by DGOR and are subject to peer review. They are released initially to sponsors and may, with sponsor approval, be released to other agencies having an interest in the material.

Directorate Research Notes are issued by directorates. They are intended to outline, develop or document proposals, ideas, analysis or models which do not warrant more formal publication. They may record development work done in support of sponsored projects which could be applied elsewhere in the future. As such they help serve as the corporate scientific memory of the directorate.

DECEMBER 1993

ACKNOWLEDGEMENT

Mrs. Rosemary Bender, MSc (Math), Senior Population Analyst in Statistics Canada, was consulted during the analysis of career progression and retention. Her comments were much appreciated by the authors.

ABSTRACT

The Minister of National Defence created the "Committee on the Canadian Military Colleges" to examine the return on investment for the Canadian Forces (CF) of the Canadian Military College (CMC) system. The Directorate of Manpower Analysis was tasked to analyze officer career progression and retention in specific military occupations with particular attention to whether the officer attended a CMC.

The promotion characteristics and retention profiles for CF officers are examined in this project report according to the commissioning plan by which the serving officer joined the regular force component. In addition, graduates under the regular officer training plan from the CMC system are compared against those that have attended civilian universities.

This project report is broken into three volumes. Volume I contains the detailed analysis of CF officers as a whole followed by a discussion on the overall study results. Volume II contains the detailed analysis of each of the MOC groups examined, and Volume III contains the detailed analysis of each of the individual MOCs studied.

RÉSUMÉ

Le ministre de la défense nationale a mis sur pied "le comité ministériel sur les Collèges militaires du Canada" afin d'examiner l'apport aux Forces canadiennes (FC) du système des collèges militaires. La Direction de l'Analyse des Effectifs dut analyser la progression de carrière des officiers et leur rétention dans certaines occupations en prenant soin de distinguer les officiers gradués des collèges militaires.

Dans ce rapport de projet les tendances dans les taux de promotion et les caractéristiques de rétention dans les FC sont examinées selon les programmes de formation pour officiers de la force régulière. De plus, une comparaison est faite entre les officiers gradués des universités civiles et ceux des collèges militaires.

Ce rapport de projet est divisé en trois volumes. Volume I contient l'analyse détaillée sur les officiers des FC suivi d'une discussion sur les résultats globals de l'étude. Volume II contient l'analyse détaillée de chaque regroupement de GPM, et Volume III porte sur l'analyse détaillée des GPM individuels.

TERMINOLOGY

For the purposes of this report, the following definitions apply:

Attrition Rate: A ratio, the numerator consisting of all releases from the trained strength of a group of officers in the Canadian Forces (CF) within a period; the denominator consisting of the trained effective strength of that group at the beginning of the period.

Canadian Military Colleges: The system of military colleges in Canada that consists of: the Royal Military College (RMC) in Kingston, Ontario; Royal Roads Military College (RRMC) in Victoria, British Columbia; and le Collège Militaire Royal (CMR) de Saint-Jean, Québec.

Eligibility Rate: A ratio, the numerator consisting of all individuals eligible for promotion out of a given rank; the denominator consisting of the total for that rank. It is calculated at a specific point in time.

Experience Profile: The distribution of the trained effective strength of a group of officers in the CF by years of commissioned service or by years of service.

Promotion Rate: A ratio, the numerator consisting of the number of officers promoted out of a given rank within a period; the denominator consisting of the eligible strength at the beginning of the period.

Retention Profile: A graph that depicts the survival probability of a group of officers as a function of experience measured by years of commissioned service or by years of service.

Time in Previous Rank Profile: Within the specific officer group being examined, it is the distribution of the strength of that group by the time spent in the previous rank.

Time in Rank Profile: Within the specific officer group being examined, it is the distribution of the strength of that group by the time spent in the current rank.

EXECUTIVE SUMMARY

1. The ultimate purpose of the study for the Ministerial Committee on the Canadian Military Colleges (MCMC) was to determine the career progression of officers from the Canadian Military Colleges (CMC) relative to other officers in the Canadian Forces (CF). Because of the complexities of CF service, this examination has been expanded to look at the progression and retention of all officers by their commissioning plan--whatever it may have been. Officers from the CMC are a sub-set of those officers that joined through the regular officer training plan (ROTP), so ROTP officers as a whole have been compared against others that entered some other way. The other sub-set of ROTP officers are those that took their education through civilian universities. This sub-set was compared, not only against their CMC counterparts, but also against the other group that received a civilian university education--the direct entry officer (DEO) with a degree (DEOD).

2. A detailed discussion comparing the results for the officer corps with those for various military occupation (MOC) groups and individual MOCs is contained in Volume I of this report. Growth in trained effective officer strength within the CF has been achieved mostly through ROTP and DEO commissioning plans. ROTP growth has been mainly due to the increased numbers of officers from the CMC. The representation of officers from the CMC increased with the capacity and the attraction of the CMC following an expansion in degree-granting authority. Officers now can graduate from any of the three colleges with a degree recognized by academia.

3. Generally, the analysis indicates that there have been significant differences between commissioning plans with

respect to promotion rates. Promotion rates have been generally higher for ROTP officers as compared with those for officers commissioned through either the officer candidate training plan (OCTP) or DEO. Statistical tests comparing promotion rates for ROTP graduates from CMCs and civilian universities did not show significant differences.

4. Retention patterns are influenced by such factors as obligatory service, generally low attrition during intermediate engagement (IE) and increased attrition as officers approach compulsory retirement age (CRA). Notwithstanding, the analysis shows that officers commissioned through OCTP generally have had better retention. In a comparison of CMC and civilian university graduates, retention for CMC officers has been generally better.

AN EXAMINATION OF OFFICER RETENTION AND CAREER PROGRESSION ACCORDING TO DIFFERENT COMMISSIONING PLANS WITHIN THE CANADIAN FORCES VOLUME I: OVERALL RESULTS

PART I - INTRODUCTION

BACKGROUND

1. In 1876 the Royal Military College (RMC) in Kingston Ontario, opened as the first of the Canadian Military Colleges (CMC). In 1948 Royal Roads Military College (RRMC), a Royal Canadian Navy institution in Victoria British Columbia, joined the CMC system when it accepted cadets from the other two services. Le Collège Militaire Royal (CMR) de Saint-Jean Québec became the third jewel in the CMC crown in 1952 when it joined the CMC system under the auspices of the Royal Canadian Air Force. A degree-granting charter was bestowed on the RMC by Ontario in 1959, RRMC obtained its charter from British Columbia in 1975 and Québec conferred degree-granting status to CMR in 1986.

2. The role of the CMC within the Department of National Defence (DND) is to educate and train officer cadets and commissioned officers for a career in the Canadian Forces (CF). The majority of officer cadets attending the CMC do so under the regular officer training plan (ROTP). The remainder are enroled under the reserve entry training plan (RETP) and the university training plan [non-commissioned members (NCM)] (UTPM).

3. On 17 December 1992 the Minister of National Defence (MND) created the "Committee on the Canadian Military Colleges" (MCMC) to examine the return on investment of the

CMC system. A subsequent directive (Reference 1) appointed the Assistant Deputy Minister (Personnel) (ADM(Per)) as the Departmental office of prime interest (OPI). Following a meeting with the Executive Director for the MCMC on 18 January 1993, the Directorate of Manpower Analysis (D Man A) was tasked (Reference 2) with providing an analysis of both officer retention and career progression rates in specific military occupations (MOC) according to the various CF commissioning plans; with specific attention to whether the officer attended CMC.

4. The MCMC requested that an initial analysis of retention be completed by 12 February 1993, with final analysis of promotion rates and of retention to be completed by mid-March. Following an extension to the MCMC mandate, D Man A also received an extended deadline.

AIM

5. The aim of this study was to provide the MCMC with an analysis of officer career progression and retention by commissioning plan. This report documents the results of this analysis.

SCOPE

6. While the MCMC initially wished to examine the status of graduates of the CMC system, these individuals had to be examined in the context of all officers commissioned in the CF. The commissioning plans analyzed in this study therefore included:

a. ROTP (these officers obtain a degree while in the CF);
b. direct entry officer (DEO) with a degree (DEOD) (these officers obtain a degree before joining the CF);
c. DEO with a diploma (DEOP) (these officers obtain a diploma before joining the CF);
d. officer candidate training plan (OCTP) from military status (OCTPM) and from civilian status (OCTPC) combined;
e. UTPM;
f. commissioned from the ranks (CFR); and
g. others (consisting mainly of unknowns, of limited duty CFR officers (LDO), and of specialist officer commissioning plans).

For the purposes of this study, tha major commissioning plans include ROTP, DEO and OCTP, while all other commissioning plans are considered as minor plans.

7. The MCMC also identified several MOCs for individual assessment:

a. armoured (ARMD) - MOC 21;
b. artillery (ARTY) - MOC 22;
c. infantry (INF) - MOC 23;
d. air navigator (ANAV) - MOC 31;
e. pilot (PLT) - MOC 32;
f. aerospace engineering (AERE) - MOC 41;
g. communications and electronic engineering (CELE) - MOC 42;
h. land electrical engineering (LEME) - MOC 43;
j. maritime engineering (MARE) - MOC 44;
k. military engineering (MILE) - MOC 45;
m. air traffic control (ATC) - MOC 63;

n. air weapons control (AWC) - MOC 64;
o. personnel administration (PADM) - MOC 68;
p. logistics (LOG) - MOC 69;
q. maritime surface and sub-surface (MARS) - MOC 71;
r. security (SEC) - MOC 81; and
s. intelligence (INT) - MOC 82.

8. These MOCs were also combined into groups for study:

a. all officers;
b. operational MOCs - MOCs 21, 22, 23, 31, 32 and 71;
c. naval MOCs - MOCs 44 and 71;
d. combat arms - MOCs 21, 22 and 23;
e. air operations - MOCs 31 and 32;
f. engineers - MOCs 41, 42, 43, 44 and 45;
g. non-maritime engineers - MOCs 41, 42, 43 and 45;
h. support MOCs - MOCs 68 and 69;
j. minor MOCs - MOCs 63, 64, 81 and 82;
k. air controllers - MOCs 63 and 64;
m. security and intelligence - MOCs 81 and 82;
n. a combination of all those MOCs identified for individual examination; and
o. a combination of all other MOCs not included above.

9. A detailed examination was made of CF officers as a whole, followed by the MOC groups and individual MOCs which contain CMC graduates in sufficient numbers for analysis. The strength of the population and the distribution by commissioning plan were first inspected, then an examination of the ROTP - CMC/civilian university composition was conducted, followed by an analysis of:

a. eligibility rates;
b. promotion rates; and
c. retention.

10. The methodology used in the data extraction and analysis is outlined in Annex A to this volume. Volume I also contains the detailed analysis of CF officers as a whole followed by a discussion of the results for all of the MOC groups and individual MOCs which contain CMC graduates in sufficient numbers. Volume II of this report contains the detailed analysis of each of the MOC groups listed in paragraph 8 which were sufficiently large to warrant discussion; and Volume III contains the detailed analysis of each of the individual MOCs identified at paragraph 7 which again were large enough for analysis.

PART II - RESULTS

CF STRENGTH AND ROTP - CMC/CIVILIAN UNIVERSITY SPLIT

11. **Tables 1 and 2** summarize the trained effective strength of officers in various commissioning plans by individual MOC and MOC group as of the first of January in 1978 and 1993. Having looked at the total officer strength and how it changed relative to the various commissioning plans, it was necessary to focus next on the ROTP, and break it into CMC and civilian university components. The 1978 and 1993 ROTP strengths are shown in **Tables 3 and 4.**

ALL OFFICERS

Strength

12. The CF officer population grew by 25 percent in the period from 1978 to 1993. For individual commissioning plan populations the changes, as illustrated in **Figure 1**, were:

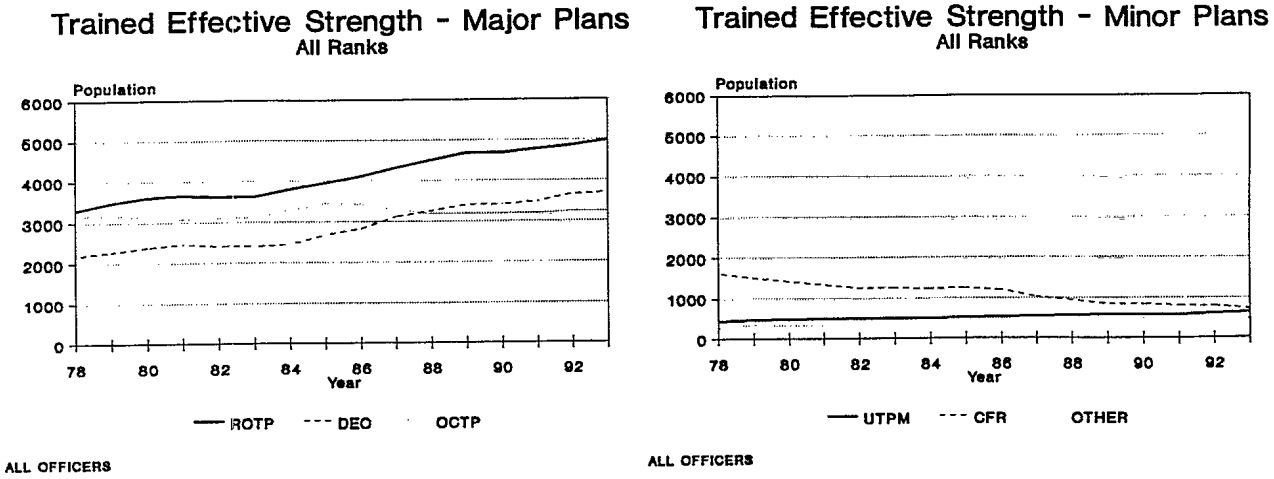

Figure 1: Trained Effective Strength
All Commissioning Plans - All Officers
Ranks - Lt to Col

a. ROTP - an increase of 51 percent over the period, most of the growth happening since 1983;

b. DEO - an increase of 69 percent, most of it having taken place since 1984;

c. OCTP - an overall increase of two percent, but with a minor decrease between 1985 and 1988 following growth from 1983 to 1985;

d. UTPM - an increase of 47 percent over the period;

e. CFR - a decrease of 55 percent, primarily in the periods from 1978 to 1982 and 1986 to 1989; and

f. other plans - an increase of 83 percent, largely between 1978 and 1982 (for all officers 'other

plans' is predominantly specialist officer commissioning plans).

Commissioning Plan Distribution

13. Because there were changes in the composition of the total population, commissioning plan distributions in the period from 1978 to 1993 were also examined and showed:

a. for all officers:

(1) ROTP - a proportion of 30 percent in 1978 increased smoothly to 36 percent by 1993,

(2) DEO - a proportion of 20 percent in 1978 increased to 27 percent by 1993 in a similar fashion to ROTP,

(3) OCTP - a proportion of 29 percent in 1978 decreased, despite minor OCTP growth, to a proportion of 24 percent by 1993, and

(4) minor plans combined - a proportion of 21 percent in 1978 decreased to 13 percent by 1993;

b. for junior officers:

(1) ROTP - a proportion of 31 percent in 1978 increased to 33 percent by 1993, but fluctuated over the period between 33 percent and 29 percent,

(2) DEO - a proportion of 17 percent in 1978 increased to 29 percent by 1993,

(3) OCTP - a proportion of 28 percent in 1978 decreased to 25 percent by 1993, having been down to 25 percent and back to 28 percent in the interim, and

(4) minor plans combined - a proportion of 24 percent in 1978 decreased to 13 percent by 1993; and

c. for senior officers all changes in distributions occurred smoothly between 1978 and 1993:

(1) ROTP - a proportion of 28 percent increased to 42 percent,

(2) DEO - a proportion of 25 percent decreased to 22 percent,

(3) OCTP - a proportion of 30 percent decreased to 22 percent, and

(4) minor plans combined - a proportion of 16 percent in 1978 decreased to 14 percent by 1982, and remained there.

ROTP - CMC/Civilian University

14. ROTP numbers in general increased by 51 percent. Whereas the CMC component increased by 87 percent, civilian university ROTP graduates decreased by 10 percent (**Figure 2**). Between 1978 and 1993, CMC graduates went from representing 58 to 72 percent of all ROTP officers; civilian university ROTP graduates decreased their representation from 42 to 25[1] percent of ROTP officers. In other words, the increase in ROTP over the period was achieved through the CMC.

[1] Total is less than 100 percent where uncertain or missing university type data has not yet been validated/corrected by the individual officer.

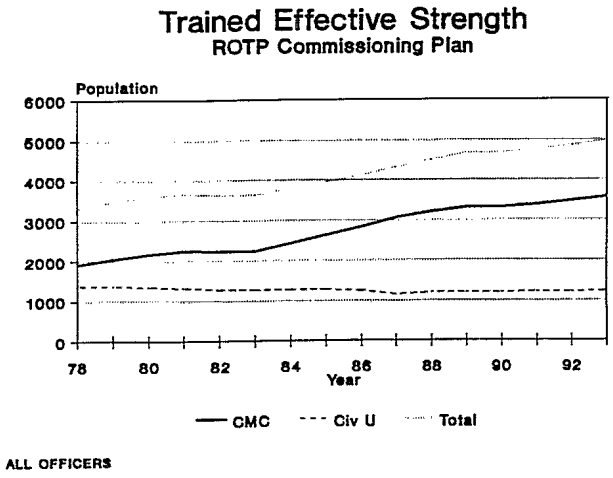

Figure 2: Trained Effective Strength
ROTP - All Officers
Ranks - Lt to Col

Eligibility Rates

15. **Major Plans** The ROTP eligibility rate at the Captain (Capt) rank has been relatively constant while the DEO and OCTP rates have been decreasing (**Figure 3**). On the other hand the DEO rate at the Major (Maj) rank has been relatively constant while the ROTP rate, consistently lower, decreased until 1988[2]. There was a similar trend at the Lieutenant Colonel (LCol) rank, although the DEO rate did drop between 1986 and 1990. Overall eligibility rates for OCTP officers have been consistently higher than those for either DEO or

[2] Because 5-year moving averages are used to graph rates for eligibility (and for promotion); dates refer to the central year.

ROTP officers, while the ROTP eligibility rates have generally been the lowest. Eligibility rates for all plans have increased, since the 1990 forces reduction programme (FRP) resulted in a drop in the number of promotions.

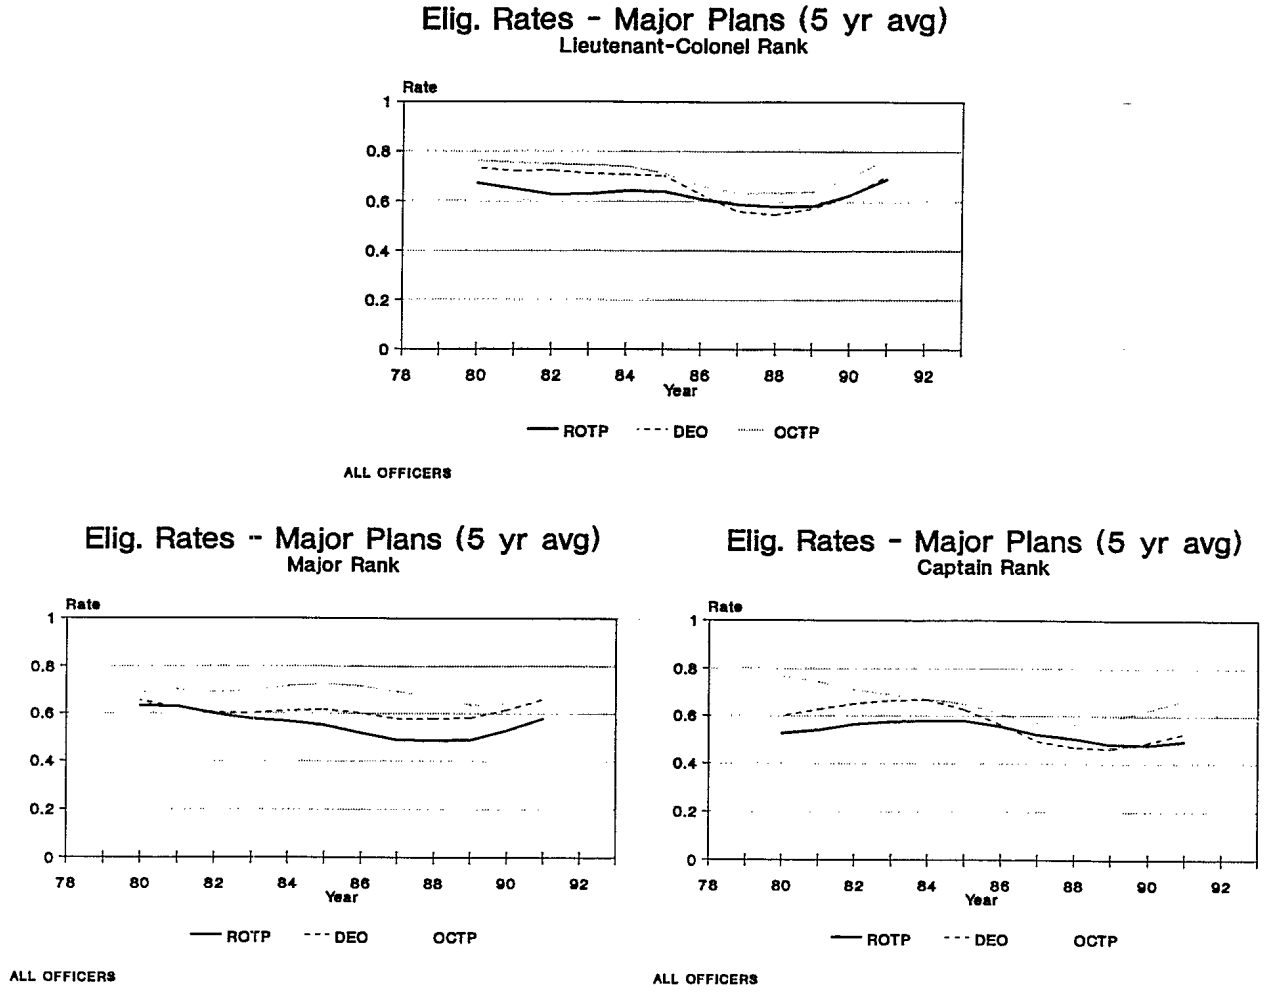

Figure 3: Eligibility Rates - Major Plans
5-year Moving Averages
All Officers

16. **ROTP - CMC/Civilian University** Eligibility rates for CMC graduates have been consistently lower at all three ranks (**Figure 4**). Eligibility rates for ROTP officers from both sources increased when the introduction of FRP resulted in a drop in the number of promotions.

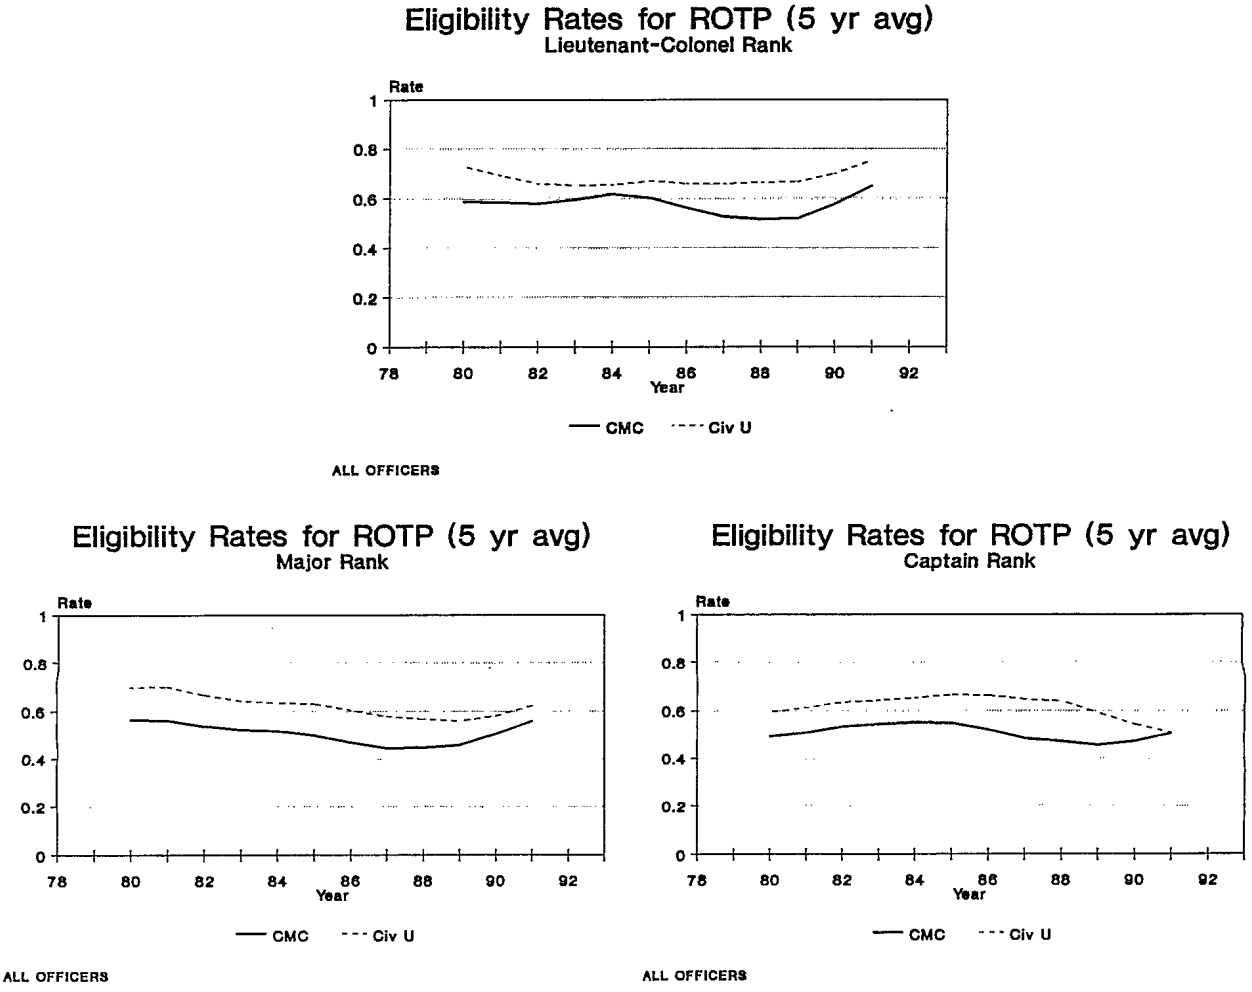

Figure 4: ROTP Eligibility Rates
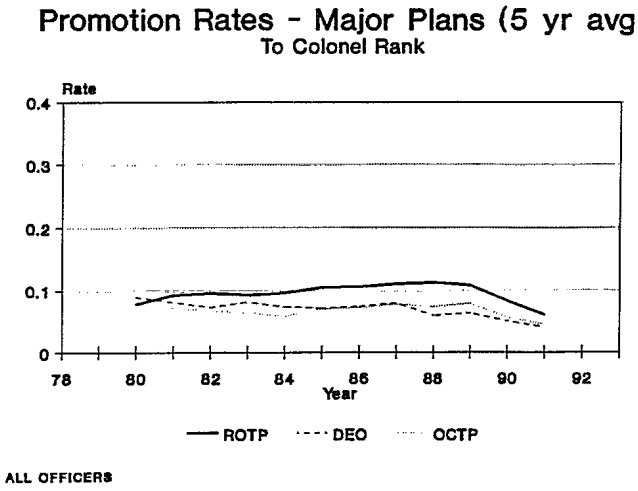
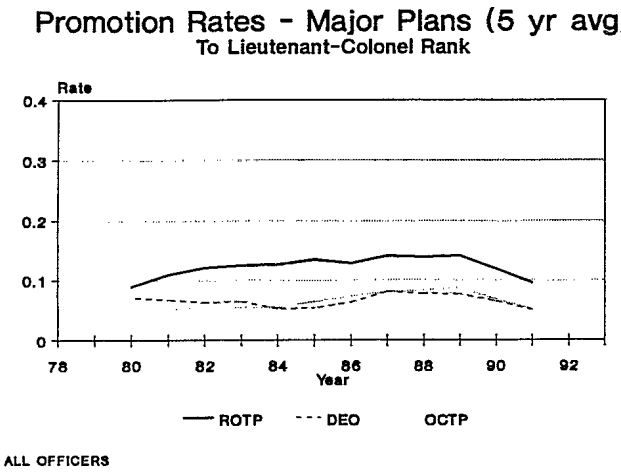
5-year Moving Averages
All Officers

Promotion Rates

17. **Major Plans** When compared to DEO and OCTP, ROTP promotion rates have been significantly[3] higher at all rank levels (**Figure 5**). (Note that ROTP eligibility at each lower rank was consistently lower--promotions from a rank remove those eligible, while at the rank in question, those same promotions increase the non-eligible portion). The DEO rate of promotion to the Maj rank was significantly higher than the OCTP rate, but the rates of promotion to the two higher ranks have been similar. The reduction in the number of promotions due to the 1990 FRP is apparent as a drop in promotion rates for all rank levels.

[3] All statements on significance were tested at the 95 percent confidence level.





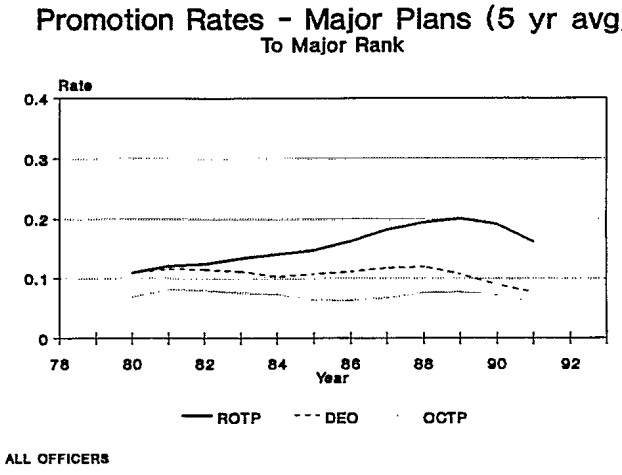


Figure 5: Promotion Rates - Major Plans
5-year Moving Averages
All Officers

18. **ROTP - CMC/Civilian University** The CMC rates of promotion to all senior ranks examined were generally higher, however statistical tests on the differences were inconclusive (**Figure 6**). The effects of the FRP are apparent at all ranks as a decline in promotion rates.

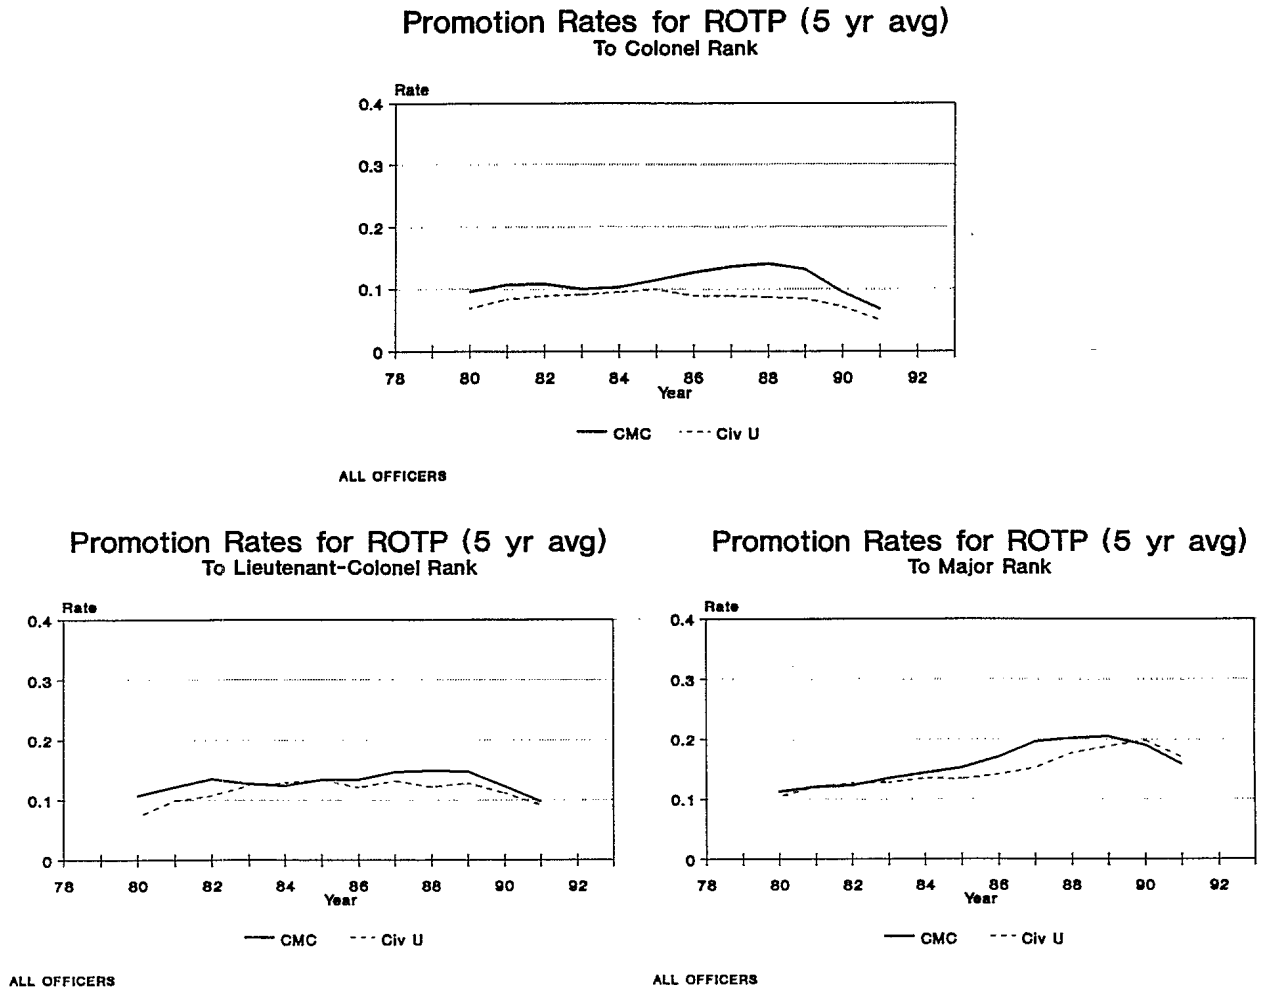

Figure 6: ROTP Promotion Rates
5-year Moving Averages
All Officers

Retention

19. **Minor Plans** The retention curves (**Figure 7**) reveal that the average length of service was 13.5 years of commissioned service (YCS) (23.8 years of service (YOS)) for UTPM officers, 10.8 YCS (27.2 YOS) for CFR officers, and 4.7 YCS (23.0 YOS)[4] for officers commissioned under other plans.

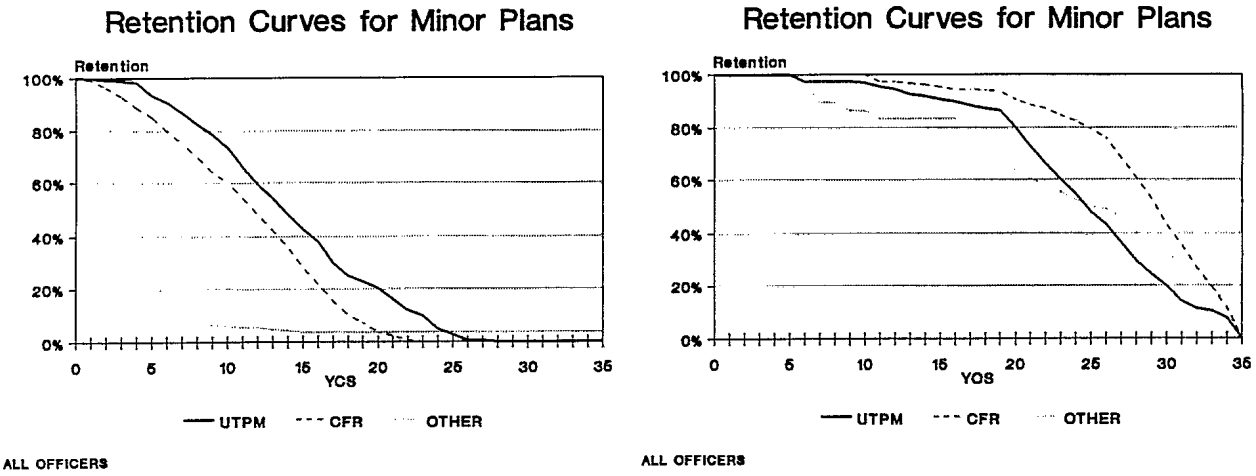

Figure 7: Minor Plan Retention Curves
All Officers

20. **Major Plans** In the YCS plot (**Figure 8**) ROTP attrition increased following three years of obligatory service, and retention levelled off near 62 percent at the

[4] The difference between the YCS and YOS graphs is because these officers have considerable service prior to commissioning.

start of the intermediate engagement (IE)[5]. ROTP/DEO differences in retention were significant until seven YCS, while ROTP/OCTP and DEO/OCTP differences were significant across the YCS plot. On the YOS curves all three plans showed an increase in attrition at the start of the IPS. DEO attrition was the greatest, and both ROTP/DEO and OCTP/DEO differences in retention were significant. The average length of service was 16.0 YCS (19.7 YOS) for ROTP officers, 15.8 YCS (17.2 YOS) for DEO officers, and 18.0 YCS (19.5 YOS) for OCTP officers.

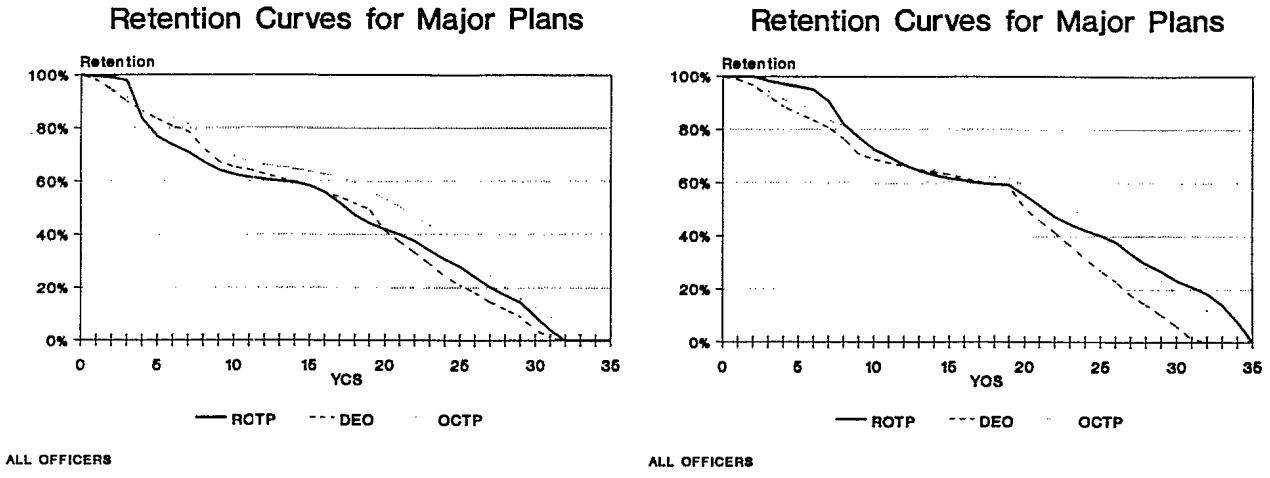

Figure 8: Major Plan Retention Curves
All Officers

21. <u>ROTP - CMC/Civilian University</u> The YCS retention curves for ROTP officers are extremely similar during the

[5] Since the officer career development plan (OCDP) was introduced, officers have been initially commissioned for a short engagement (SE), a period that goes to nine YCS. Those officers that accept an offer of an IE then may serve until completing 20 YOS, and those that subsequently accept an offer of an indefinite period of service (IPS) continue to serve beyond 20 YOS until age 55.

first five years (**Figure 9**). CMC attrition started to level earlier but attrition for officers from a civilian university background continued at a slightly higher rate until nine YCS. The YOS curves indicate that civilian university officers entered their post-obligatory attrition earlier than CMC officers, with significant differences in retention until 12 YOS. About 62 percent of CMC and 57 percent of civilian university officers remained through the IE; differences in retention being significant from 15 to 17 YOS. Both plans had similar attrition characteristics from the start of the IPS until 26 YOS. Officers from civilian universities had a significantly greater propensity to leave at 28 YOS. The average length of service was 16.2 YCS (20.5 YOS) for ROTP officers from CMC and 15.8 YCS (18.9 YOS) for ROTP officers from civilian universities.

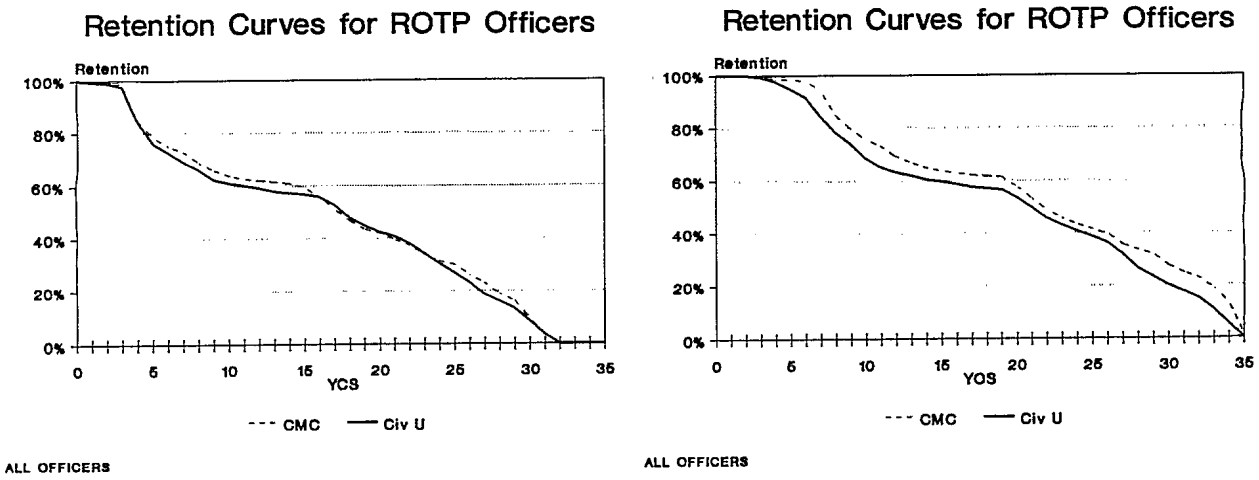

Figure 9: ROTP Retention Curves
All Officers

22. <u>Civilian University - ROTP/DEOD</u> Of those that attended civilian universities, DEOD officers experienced fairly consistent attrition until 20 YCS (YOS), whereas

attrition for ROTP officers started following three years of obligatory service and was high until five YCS. Neither curve showed any response to the nine YCS gratuity offered at the end of the short engagement (SE) (**Figure 10**). DEOD retention was near 60 percent at the 20 YOS-point, while ROTP retention was near 57 percent. During the IPS DEOD retention was significantly lower than for ROTP officers. The average length of service was 15.8 YCS (18.9 YOS) for ROTP officers from civilian universities and 16.5 YCS (17.2 YOS) for DEOD officers.

All Officers

PART III - DISCUSSION

RECRUITMENT

23. The only source of CF personnel is from amongst those that have been drawn into recruitment centres across the country. Active recruitment is conducted through the media; through briefing sessions offered in high schools, colleges and universities; and through displays set up at major attractions. Recruits are subjected to basic training, followed by specific trade and occupational training, before employment at any level within the CF. In other words, basic recruitment simply gets people into the CF, how or where they are employed is another process.

24. Leaders, managers and executives of the CF are designated as officers, and are acquired through selective recruitment. The selection of officer candidates for service in the CF is a complex process that is complicated by the front-end loaded[6] nature of the CF personnel system.

25. The recruitment process must consider the potential of the individual as well as his current qualifications to fulfil the needs of the CF. To accomplish this the CF recruits officers from a variety of sources which include:

a. educated candidates through DEO;

b. experienced military NCM personnel through OCTPM, UTPM, CFR and LDO; and

---

[6] The front-end loaded system is one that recruits the uninitiated, trains them, passes training graduates into the bottom of the hierarchy, and then promotes from within to fill vacancies at higher levels. The CF hierarchy is defined by military rank.

c. candidates showing leadership potential and desirous of higher education through OCTP, ROTP and RETP.

26. This paper is focused on officers that have been assigned to an MOC, who have completed initial occupational training and who have been (or are) employed in one of the MOCs under study. An officer's commissioning plan is indicative of which qualifications were possessed by an individual when recruited.

CAREER PROGRESSION ANALYSIS

Strength

27. As summarized in **Table 5**, the growth in trained effective strength is apparent in all individual MOCs and MOC groups except for air operations (air ops). When CF growth is examined by commissioning plan, it is evident that the strength of ROTP and DEO officers has increased everywhere, even in air ops, while CFR strength has decreased. The observed increase in strength has been larger for DEO than for ROTP in most of the MOC groups and individual MOCs; the exceptions being a larger increase in ROTP strength in the minor MOCs combined and in the individual INF, ANAV, AERE and CELE MOCs. For the 'other' plans global increases in the number of officers are apparent; the fact that increases are disproportionately large reflects that the 'other' plans have not been overly utilized in the past.

Table 5: Trained Effective Strength Percentage Change from 1978 to 1993

	INF MOC23	ANAV MOC31	PLT MOC32	AERE MOC41	CELE MOC42	LEME MOC43	MARE MOC44	MILE MOC45	LOG MOC69	MARS MOC71
CMC	↑ 85	↑ 58	↑ 49	↑ 150	↑ 91	↑ 107	↑ 210	↑ 54	↑ 50	↑ 68
CIV U	↓ 17	↓ 9	↓ 33	↓ 24	↓ 10	↓ 24	↑ 40	↓ 46	↓ 10	↓ 13
ROTP	↑ 47	↑ 35	↑ 21	↑ 87	↑ 53	↑ 58	↑ 167	↑ 20	↑ 23	↑ 40

28. When the trained effective strength of ROTP officers is analyzed according to university type, as illustrated in **Table 6**, substantial growth in the use of CMC is apparent throughout. On the other hand, the use of ROTP at civilian universities has grown only for the naval and minor MOC groups, and within the naval group the growth has been specifically for MARE officers. In these two MOC groups, however, the growth in the number of ROTP officers from the CMC has been even more substantial than that seen for ROTP officers from civilian universities.

Commissioning Plan Distribution

29. Having identified changes in trained effective strength, the representation of ROTP and DEO officers has increased as expected, generally at the expense of officers from OCTP and the minor plans. As exceptions the commissioning plan distribution in the naval and minor MOC groups (**Table 7**) and in the MARS MOC (**Table 8**) show increased OCTP representation.

30. DEO representation has increased within the junior ranks for all MOCs and MOC groups in which the strength increased. DEO junior rank (Capt and below) representation remains unchanged only for the unique MOC that decreased in strength (ANAV). OCTP representation within the junior ranks has increased only in the naval and minor MOC groups, and in the MARS and MILE MOCs. Changes in ROTP representation have been variable within the junior ranks.

31. Within the senior ranks (Maj and above) the proportion of ROTP officers has increased throughout. For MOC groups, DEO representation is unchanged in air ops and has increased only in the naval group. DEO officer representation has varied considerably across the individual MOCs. OCTP representation in the senior ranks has increased only in the minor MOC group, and in the MARS and INF MOCs.

32. Since there has been considerable growth in the strength of those ROTP officers that come from CMC, it is not surprising that the representation of these officers has also increased (**Table 9**). The CMC/civilian university split, about 60/40 in 1978 for all operational MOCs and MOC groups, shifted to 75/25 by 1993; for engineering officers the split went from 60/40 to about 80/20; and for the support and minor MOCs and MOC groups the split generally went from about 50/50 to 65/35.

Table 9: ROTP - Proportions in 1978 and 1993
CMC/Civilian Universities[7]

[7] Total is less than 100 percent where uncertain or missing university type data has not yet been validated/corrected by the individual officer.

Eligibility Rates

33. In an analysis of career progression the automatic tendency of comparing the number promoted to the rank population from which they were elevated is improper. A promoted individual can only come from the eligible sub-set of a rank population, not the whole population[8]. The eligibility rates for the individual MOCs and the MOC groups have therefore been examined and are summarized in the following tables. No statistical tests were conducted, but tabulated comments incorporate reasoned judgement on the data available. Where data was lacking or where differences were not obvious, little was said.

34. In examining the eligibility rate at any rank, it must be remembered that a high rate of promotion into or out of that rank will keep the eligibility rate low. Promotions remove those officers eligible from the lower rank while at the higher rank, promotions add to the non-eligible portion.

35. In **Table 10** which summarizes the eligibility rates for MOC groups it is apparent that the general eligibility of ROTP and DEO officers is lower than that for OCTP officers. When DEO and ROTP officer eligibility is compared, differences are less obvious, but ROTP eligibility is frequently lower. Within ROTP, CMC eligibility is predominantly lower than that for ROTP officers from civilian universities.

---

[8] Eligibility for promotion in this study is based solely on a minimum time in rank criterion varying with rank. Details of this methodology are found in Annex A.

Table 10: Comparison of Group Eligibility Rates

~ - represents no consistency in trends

36. In an examination of **Table 11**, it is apparent that generalized comments on eligibility rates for individual MOCs are more difficult to make as many of the MOCs either do not have sufficient numbers for calculations or do not have concrete trends. AERE is the only MOC where ROTP eligibility rates are lower than those for DEO at all three ranks; ANAV and LOG are the only MOCs where ROTP rates are also consistently lower than those for OCTP. In a comparison of DEO and OCTP eligibility rates, only the ANAV MOC shows a consistent trend with the DEO rates being lower. CMC eligibility rates are generally lower than those for civilian universities - the exception being the MARE MOC. In this MOC, the CMC eligibility rate is lower only at the Cdr rank.

Promotion Rates

37. **ROTP compared with DEO** In the analysis of promotion rates in the MOC groups (**Table 12**), ROTP rates have been generally higher, and for promotions to the ranks below Col these differences have been generally significant[9]. In the analysis of promotion rates in the individual MOCs (**Table 13**), trends are less visible. Where numbers are sufficient for analysis, ROTP rates are generally higher but only significantly so in a few MOCs: in the PLT MOC for promotion to Maj and LCol, in the CELE and MARE MOCs for promotion to LCol and in the LOG MOC for promotion to Maj.

38. **ROTP compared with OCTP** ROTP promotion rates have generally been significantly higher than those for OCTP in all of the MOC groups. Where the number of OCTP officers is sufficient for study in the individual MOCs, ROTP promotion rates have also been consistently higher and significantly so in most cases.

39. **DEO compared with OCTP** DEO promotion rates to the Maj rank have been higher in all of the MOC groups except the support MOC group, and generally the differences have been significant. On the other hand, promotion rates to the LCol rank in the MOC groups have been similar. Promotion rates to the Col rank favoured DEO officers in combat arms and significantly so in the minor MOCs, but favoured OCTP officers in the non-maritime engineering and support MOC groups. DEO promotion rates to the Maj rank have also been higher in the individual INF, PLT, CELE and MARS MOCs, and have been significantly higher in the ANAV MOC. Where there have been

---

[9] The term "significant" used throughout the analysis pertains to the results of statistical tests conducted at the 95% confidence level.

sufficient data for analysis of promotion rates to the LCol and Col ranks, statistical tests do not support any evidence of significant differences. The DEO promotion rate to Col in the INF MOC has been higher while it has been lower in the LOG MOC.

40. **CMC compared with Civilian Universities** When comparing the promotion rates for the MOC groups, the CMC rates of promotion to the Col rank have been generally higher but only significantly so in air ops. The CMC and civilian university rates to the Maj and LCol ranks have been generally similar in the MOC groups. Similar trends are seen in the individual MOCs. The CMC rates have actually been lower at the Maj rank in the ANAV, MILE and MARS MOCs and at the LCol rank in the MARS MOC.

OFFICER RETENTION ANALYSIS

General

41. Contractual terms of service are generally defined relative to YCS or to YOS, so the retention profiles presented in this study depict survival probabilities within MOC groups and individual MOCs as a function of experience measured both ways. Conversion to an IE after the SE is specified in terms of YCS, so YCS curves were produced primarily to examine early retention/attrition. The conversion to an IPS at the end of the IE is specified in terms of YOS, so YOS curves were produced to examine service beyond ten YCS (or after 13-15 YOS).

42. Recent studies[10] have shown that attrition rate patterns related to CF terms of service have developed over time. There are low periods of attrition during the initial and mid-life stages of a member's career due to periods of obligation and 'pension lock-in'. In those occupations where professional demand is high outside the CF, attrition rates increase sharply after obligatory service, and rates increase again around nine YCS. Officers that accept an IE generally serve until entitled to a pension at 20 YOS which results in a period of low attrition from 14 to 20 YOS. The attrition rate then increases beyond 20 YOS as a result of IPS conversion policies combined with the fact that some seek other careers with the financial security of a CF pension. The attrition rate continues to increase slightly thereafter, influenced additionally by such issues as: no pension penalties after 28 YOS, full pension after 35 YOS, and compulsory retirement age (CRA).

---

[10] References 3, 4 and 5.

43. Because attrition rates follow patterns related to periods of service, statistical testing was conducted on data grouped into three periods of service:

a. from zero to 10 years;
b. from 11 to 20 years; and
c. beyond 20 years.

Identical testing was conducted on that service measured in both YCS and YOS.

Comparison of Retention Patterns

44. **ROTP compared with DEO** In the comparison of ROTP and DEO retention by YCS (**Tables 14 and 16**), the influence of obligatory service for ROTP officers results in significant differences in retention patterns in the first 10 YCS. Retention is better for ROTP officers in the first few years but following the period of obligatory service (5 to 10 YCS) DEO retention is better. Comparative analysis by YOS (**Tables 15 and 17**) shows that after 20 YOS ROTP retention is better.

45. **ROTP compared with OCTP** The influence of obligatory service for ROTP officers can also be seen in the comparison of retention for ROTP and OCTP officers. In most cases the differences are once again significant although there were insufficient numbers of OCTP officers in the engineering MOCs for analysis. Retention beyond 10 YOS is better for OCTP officers with the exception of air ops and all operational MOCs combined.

46. **DEO compared with OCTP** There are few significant differences in YCS retention patterns for DEO and OCTP officers in the first 10 YCS. On the other hand OCTP

retention beyond 10 YOS is significantly better than DEO retention across the MOC groups. There were insufficient numbers to comment on for individual MOCs.

47. **ROTP/CMC compared with ROTP/Civilian Universities** Retention for ROTP officers from CMC is generally better in the first 10 YCS than retention for ROTP officers from civilian universities, however the statistical tests do not indicate significant differences. Retention for ROTP officers from CMC is also better beyond 10 YOS, significantly so only in air ops MOCs.

48. **ROTP/Civilian Universities compared with DEOD** The influence of obligatory service for ROTP officers from civilian universities can also be seen in the comparison of retention for ROTP and DEOD officers. The statistical tests do not show any significant differences. Retention in the period from 10 to 20 YOS is better for DEOD officers except for the PLT MOC where retention is significantly better for ROTP officers. Beyond 20 YOS where numbers were sufficient for analysis ROTP officers have better retention.

Average Length of Service

49. **General** The average (the numerical mean) years of retention for officers that joined the CF through the different commissioning plans are tabulated according to the MOC groups in **Tables 18 and 19** and the individual MOCs in **Tables 20 and 21** by YCS and by YOS respectively. In these Tables the shortest retention is identified in bold print, and the longest is italicized.

50. **Minor Commissioning Plan Comparison** When examined by YCS the retention of UTPM officers has always been good, best in all but the MARS MOC. This retention pattern reflects the ten years or so that these officers have already served in the ranks. The shorter YOS retention of UTPM officers reflects the better employment opportunities available to individuals with a degree. Special commissioning plan and CFR officers are personnel committed to the CF, and having accepted a commission, they frequently continue to serve as long as they can before CRA, aspects reflected by both short YCS and long YOS retention.

Shortest Retention is in Bold
Best Retention is Italicized

51. **Major Commissioning Plan Comparison** The examination by YCS indicates that OCTP retention is generally the best, except in the air ops and support MOC groups and in the PLT MOC. ROTP retention is generally the shortest. In the MOC groups and individual MOCs where ROTP retention is not the shortest then DEO retention is generally the shortest. The examination by YOS indicates that DEO retention has generally been the shortest for both the MOC groups and the individual MOCs. ROTP retention by YOS is more frequently the longest.

52. **ROTP - CMC/Civilian University Comparison** The retention of ROTP officers has been best for those from CMC in all cases, except combat and the support MOC group and the INF and AERE MOCs. Similarly CMC retention has been best in all cases but the INF MOC.

53. **Civilian University - ROTP/DEOD Comparison** DEOD retention has generally been the longest, more so in the MOC groups than the individual MOCs. Retention by YOS has generally been shortest for DEOD. The obligatory service required of ROTP officers provides the simple explanation for the better YOS retention of those ROTP officers that attend civilian universities.

PART IV - CONCLUDING MATERIAL

SUMMARY

54. The ultimate purpose of the MCMC study was to determine the career progression of officers from the CMC relative to other officers in the CF. Because of the complexities of CF service, this examination has been expanded to look at the progression and retention of all officers by their commissioning plan--whatever it may have been. Officers from the CMC are a sub-set of those officers that joined through ROTP, so ROTP officers as a whole have been compared against others that entered some other way. The other sub-set of ROTP officers are those that took their education through civilian universities. This sub-set was compared, not only against their CMC counterparts, but also against the other group that received a civilian university education--the DEOD officers.

55. Growth in trained effective officer strength within the CF has been achieved mostly through ROTP and DEO commissioning plans. ROTP growth has been mainly due to the increased number of officers from the CMC. The representation of officers from the CMC increased with the capacity and the attraction of the CMC following an expansion in degree-granting authority. Officers now can graduate from any of the three colleges with a degree recognized by academia.

56. Generally, the analysis indicates that there have been significant differences between commissioning plans with respect to promotion rates. Promotion rates have been generally higher for ROTP officers as compared to those commissioned through either OCTP or DEO. Statistical tests did not reveal any significant differences in promotion rates for ROTP graduates from CMCs and civilian universities.

57. Retention patterns are influenced by such factors as obligatory service, generally low attrition during IE and increased attrition as officers approach CRA. Notwithstanding, the analysis shows that officers commissioned through OCTP generally have had better retention. In a comparison of CMC and civilian university graduates, retention for CMC officers has been generally better.

CONCLUSIONS

58. The conclusions derived from this study are presented in the following subparagraphs corresponding to the structure of the analysis:

a. the strength of the CF officer population has changed over time:

(1) the trained effective strength has increased since 1978 in all of the officer MOCs studied except air ops,

(2) the number of ROTP and DEO officers has increased in all MOCs, while the number of CFR officers has decreased, and

(3) the number of ROTP officers from CMC has increased in all MOCs studied, while the number of ROTP officers from civilian universities has increased only in the MARE MOC and in the minor MOC group;

b. as a result of the changes in the population the commissioning plan distributions have also shifted:

(1) the representation of both ROTP and DEO officers have increased at the expense of the other commissioning plans,

(2) the proportion of OCTP officers has increased only in the MARS MOC and in the minor MOC group, and

(3) DEO representation has increased predominantly in the junior officer ranks while ROTP representation has increased predominantly in the senior officer ranks;

c. more specifically, when considering the proportion of ROTP graduates from CMC versus civilian universities, the following changes have occurred:

(1) the proportions of CMC and civilian university graduates have shifted from a 60/40 split in 1978 to a 75/25 split by 1993 in the operational MOCs,

(2) the proportions of CMC and civilian university graduates have also shifted in the engineering MOCs from a 60/40 split in 1978 to an 80/20 split by 1993, and

(3) in the support and minor MOCs the proportions of CMC and civilian university graduates have shifted from a 50/50 split in 1978 to a 65/35 split by 1993;

d. when examining career progression in terms of promotion rates very little was derived from the analysis on individual MOCs due to small numbers. MOC groups however have revealed interesting trends including:

(1) promotion rates for ROTP officers have been generally better than rates for either DEO or OCTP officers, and significantly so in most MOC groups,

(2) promotion rates to the rank of Maj for DEO officers have been higher than those for OCTP officers but the promotion rates have been similar to the higher ranks, and

(3) ROTP graduates from CMC and civilian universities have experienced similar promotion rates except to the rank of Col where CMC graduates have enjoyed higher promotion rates;

e. some general observations on retention patterns in the CF include:

(1) officers from the minor commissioning plans, CFR and LDO in particular, are commissioned late in their careers and remain in the CF for only a short period of time. Therefore, it is not useful to compare retention patterns from these plans with those from the major commissioning plans (ROTP, DEO and OCTP),

(2) obligatory service strongly influences retention patterns in the early stages of an officer's career,

(3) regardless of commissioning plan attrition is low after 9 YCS while officers are on an IE, and

(4) after 20 YOS differences in retention patterns by commissioning plan do emerge as attrition increases towards CRA; and

f. comparative analysis of retention patterns for the individual MOCs revealed little due once again to small numbers. General trends in retention for MOC groups do indicate:

(1) retention of ROTP officers is better than DEO or OCTP while they attend CMC and complete their period of obligatory service. Thereafter high attrition from ROTP results in lower retention to 9 YCS,

(2) retention of OCTP officers is better than for both DEO and ROTP after 9 YCS, significantly so in the engineering MOCs. The exception occurs in air ops where ROTP retention is significantly better,

(3) retention of ROTP officers from CMCs is better than for ROTP officers from civilian universities and significantly so in air ops. The exceptions are in the combat arms and support MOC groups, and

(4) retention of ROTP officers from civilian universities as compared to that for DEOD officers is better during the period of obligatory service and after 20 YOS.

ANNEX A
TO D MAN A PR 649 - VOL I
DECEMBER 1993

METHODOLOGY

INTRODUCTION

1. This annex describes the methodology used for the comparative analysis of career progression and officer retention by commissioning plan in support of a request from the Ministerial Committee on the Canadian Military Colleges (MCMC).

SCOPE

2. It was apparent from the tasking that the study would be based on historical data covering the period from 1978 to 1992 inclusive. From preliminary discussions with the MCMC it was also determined that the analytical results were to include discussion for specific individual military occupations (MOC):

a. armoured (ARMD) - MOC 21;

b. artillery (ARTY) - MOC 22;

c. infantry (INF) - MOC 23;

d. air navigator (ANAV) - MOC 31;

e. pilot (PLT) - MOC 32;

f. aerospace engineering (AERE) - MOC 41;

g. communications and electronic engineering (CELE) - MOC 42;

h. land electrical and mechanical engineering (LEME) - MOC 43;

j. maritime engineering (MARE) - MOC 44;

k. military engineering (MILE) - MOC 45;

m. air traffic control (ATC) - MOC 63;

n. air weapons control (AWC) - MOC 64;

o. personnel administration (PADM) - MOC 68[1];

p. logistics (LOG) - MOC 69;

q. maritime surface and sub-surface (MARS) - MOC 71;

r. security (SEC) - MOC 81; and

s. intelligence (INT) - MOC 82[2].

3. The Directorate of Manpower Analysis's (D Man A) experience with historical trend analysis suggested that some of these MOCs would be too small for any meaningful analysis so it was felt that MOCs should be aggregated in a systematic manner. The MOC groups for analysis included:

a. all officers;

b. operational MOCs - MOCs 21, 22, 23, 31, 32 and 71;

c. naval MOCs - MOCs 44 and 71;

d. combat arms - MOCs 21, 22 and 23;

e. air operations (air ops) - MOCs 31 and 32;

f. engineers - MOCs 41, 42, 43, 44 and 45;

g. non-maritime engineers - MOCs 41, 42, 43 and 45;

h. support MOCs - MOCs 68 and 69;

j. minor MOCs - MOCs 63, 64, 81 and 82;

k. air controllers - MOCs 63 and 64;

---

[1] PADM - MOC 68 data did not show up until 1979 following its creation.

[2] MOC 82 - INT was too small for valid statistical testing; and until 1983 it existed as a sub-component of MOC 81- SEC. The two were therefore recombined in this study.

m. security and intelligence - MOCs 81 and 82;

n. a combination of all those MOCs identified for individual examination: MOCs 21, 22, 23, 31, 32, 41, 42, 43, 44, 45, 63, 64, 68, 69, 71, 81 and 82; and

o. a combination of all other MOCs not included above: MOCs 48, 49, 51, 52, 53, 54, 55, 56, 57, 58, 59, 61, 62, 65, 66, 67, 72, 73, 74, 75, 76, 77 and 79.

4. While the MCMC wished to examine the career progression and retention characteristics of graduates of the Canadian Military College (CMC) system, these individuals had to be examined in the context of all other officers within the Canadian Forces (CF). Consequently the analysis was to encompass the following commissioning plans:

a. regular officer training plan (ROTP) (these officers obtain a degree while in the CF);

b. direct entry officer (DEO) with a degree (DEOD) (these officers obtain a degree before joining the CF);

c. DEO with a diploma (DEOP) (these officers obtain a diploma before joining the CF);

d. officer cadet training plan (OCTP) from military status (OCTPM) and from civilian status (OCTPC) combined;

e. university training plan for non-commissioned members (UTPM);

f. commissioned from the ranks (CFR); and

g. others (consisting mainly of unknowns and of limited duty CFR officers (LDO) for those military occupations (MOCs) under study, and of specialist officer commissioning plans for some of the other MOCs).

5. The analysis also had to be broken down by college type (ie CMC or civilian university) for a proper comparative analysis of career progression and retention patterns of ROTP graduates.

DATA EXTRACTION

6. It was clear from the tasking and the scope of the problem that massive data extractions would be required. Familiarity with the Military Personnel Information System (MPIS) data elements combined with the requirements of the MCMC resulted in a decision to approach the data extraction in two phases:

a. the first phase to enable analysis of career progression of officers from various commissioning plans; and

b. the second phase to permit analysis of retention patterns for officers from the various commissioning plans by years of commissioned service (YCS) and by years of service (YOS).

7. The historical active tapes of the MPIS were the source of all data used for the career progression analysis; and the MPIS release tapes provided attrition data required for the retention analysis. All extracted data were confined to the post-1977 period, since the MPIS tapes prior to 1978 proved to contain incomplete data on the commissioning plan under which officers were enrolled.

8. For commonality throughout the study data were extracted by:

a. rank;

b. commissioning plans;

c. college types as recorded in the MPIS under the 'university' field;

d. MOCs identified for individual assessment; and

e. MOCs identified for assessment collectively in MOC groups.

9. For the career progression phase of the analysis the population was restricted to the trained effective strength less those on extension. 'Trained' was defined for the whole study as those assigned to an MOC but not annotated within the MPIS as being untrained[3]. Data were extracted from the 1977 to 1992 year-end tapes (inclusive); and were sorted by MOC, by commissioning plan and by rank.

10. Data for the career progression analysis of the minor commissioning plans (UTPM, CFR and 'others') encompassed:

a. the strength count; and

b. the promotion count.

11. The more detailed career progression analysis associated with the major commissioning plans (ROTP, DEO and OCTP) and with the CMC/civilian university comparison for ROTP officers encompassed combinations of commissioning plan and college types that included:

a. OCTP with all recorded college types combined;

b. DEO with both DEO(D) and DEO(P) combined;

c. DEO(D) with all recorded college types combined;

d. ROTP from CMC;

---

[3] i.e. the MOC alphanumeric code does not end with a 'U', and the MOC is not 98 (under training) or 99 (not allotted).

e. ROTP from civilian university; and

f. ROTP from unknown/undefined sources.

12. Within each of these combinations of commissioning plan and college type, data extracted and sorted by MOC and by rank included:

a. the strength count;

b. the promotion count;

c. the time in rank (TIR) distribution (0 to 15+ years); and

d. the time in previous rank (TIPR) distribution (0 to 15+ years).

13. The data obtained for the retention analysis consisted of:

a. attrition data obtained from the MPIS release tape. Separate records for each trained officer that was recorded as having been released between 1 January 1978 and 31 December 1992 were obtained[4]. The extraction included:

(1) MOC, (as one of the 17 individual MOCs identified above, or as others),

(2) commissioning plan,

(3) college type,

(4) YCS,

(5) YOS,

(6) rank at release, and

(7) release year; and

---

[4] Data on General (Gen) rank officers (all officers above the Col/Capt(Navy) (Capt(N)) rank) - MOCs 11 and 12 - had to be included with data of the MOC from which each originated for an accurate analysis of retention.

b. strength data obtained from the MPIS annual historical tapes. The data were aggregated over the period 1978 to 1992 and were sorted by MOC, commissioning plan, college type and rank. The extraction from the trained effective strength of officers encompassed all officers not on extension.

ANALYTICAL CONSIDERATIONS

Promotion Rate Analysis

14. In an analysis of promotion rates, an automatic but inaccurate tendency is to compare the number promoted to the population from which they were elevated. However, only the eligible sub-set of any rank population can provide officers for promotion. For the purposes of this study, eligibility was based solely on a minimum TIR[5] criterion that varies with rank:

a. Colonel (Col) - at least two years[6];

b. Lieutenant Colonel (LCol) - at least three years;

c. Major (Maj) - at least four years;

d. Captain (Capt) - at least four years; and

e. Lieutenant (Lt) - at least three years.

15. Promotion to the rank of Capt is based predominantly on seniority, and there is little to segregate it from an automatic advancement. On the other hand promotion to senior

[5] TIR is the difference between the end of the year and the date of the last promotion.

[6] There is no minimum TIR prior to promotion from the rank of Col, but the observed minimum has never been less than two years. Within D Man A a minimum has therefore been applied for the purposes of all manpower related studies and models.

ranks (i.e. Maj, LCol and Col) is by selection; the number of officers at each of the higher ranks is controlled. This study was limited to an examination of promotion rates to the senior ranks only, where rates may be meaningful.

Retention Analysis

16. A good retention profile can be obtained from average attrition rate information. The total number of releases occurring at each YCS (or YOS) is divided by the strength in each YCS (or YOS). This method provides a reliable means of comparing commissioning plan retention in a quantitative fashion since each point in the profile is standardized to the strength at that point. Appendix A1 contains the accumulated release data that were used for generating the retention profiles.

DATA PRE-PROCESSING IN BASIC[7]

17. The way in which data was obtained from the MPIS required further aggregation prior to final processing for analysis. Pre-processing was accomplished on a number of powerful desk-top computers using BASIC to split the extremely large files extracted from the MPIS into separate MOC-specific data, and then to:

a. prepare the data for the career progression analysis of ROTP and the CMC/civilian university comparison by aggregating:

(1) TIR data across all college types to obtain overall ROTP totals,

[7] BASIC (beginner's all-purpose symbolic instruction code) is a simple computer programming language excellent for file manipulation.

(2) TIR data to yield the eligibility strength, and

(3) TIR data across all years in rank to yield the total strength; and

b. prepare the data for the retention analysis by:

(1) aggregating the releases over all ranks for the years of 1978 to 1992,

(2) combining the release data for individual MOCs into multiple MOC groupings, and

(3) aggregating strengths over all ranks.

SPREADSHEET DATA CALCULATIONS

18. Following data extraction and pre-processing, final production of tables and curves for analysis was accomplished through Lotus[8] spreadsheets. Five Lotus spreadsheets were developed for the career progression analysis of this study, and two spreadsheets for the retention analysis.

19. The five Lotus spreadsheets designed to produce rank totals and sub-totals for representation, eligibility and promotion rates in the career progression analysis phase of the study were:

a. a strength spreadsheet into which strength data organized by commissioning plan, college type, rank and year (i.e. each historical year for which data were extracted) were imported to produce:

(1) rank totals, and

(2) junior[9] and senior rank sub-totals;

---

[8] Lotus is a registered trademark of Lotus Development Corporation.

[9] Junior - ranks from Lt to Capt.

b. a distribution spreadsheet into which strength data from the strength spreadsheet were copied to generate annual strengths distributed by the commissioning plans of ROTP, DEO, OCTP and the 'rest' (i.e. all other commissioning plans) for:

(1) all ranks combined,

(2) senior ranks, and

(3) junior ranks;

c. a TIR spreadsheet into which the eligible and total TIR data were retrieved to calculate:

(1) yearly eligibility rates by rank, for ranks from Capt to LCol. Eligibility rates are ratios of those eligible for promotion from a given MOC, rank and commissioning plan, to the MOC and commissioning plan total for that rank, and

(2) eligibility rates as 5-year moving averages to obtain larger numbers and to smooth out annual fluctuations. The rates were calculated as the number eligible within a 5-year period divided by the total of the annual strengths (at the beginning of each year) within the period;

d. a promotion spreadsheet into which promotion data sorted by commissioning plan, college type and rank were retrieved to produce:

(1) rank totals, and

(2) junior and senior rank sub-totals; and

e. a promotion rate spreadsheet into which eligible strengths and promotion data, from the TIR and promotion spreadsheets, were retrieved to calculate:

(1) yearly promotion rates by rank. Each rate was calculated as the annual number of promotions for an MOC and commissioning plan, divided by the annual eligible strength at the beginning of each year, and

(2) promotion rates as 5-year moving averages so as to obtain larger numbers and to smooth out annual fluctuations. These rates were calculated as the number of promotions within a 5-year period divided by the total of the annual eligible strengths (at the beginning of each year) within the period.

20. The two Lotus spreadsheets developed from the total trained strength for the retention analysis were:

a. a retention by YCS spreadsheet into which YCS data, organized by MOC, commissioning plan and college type, were imported to produce:

(1) yearly attrition rates for each combination. Each rate was calculated as the annual number of releases from each group, divided by the trained effective strength of that group at the beginning of each year,

(2) the probability of survival to each YCS, which is obtained by accumulating those that remain (the survivors) as a percentage after annual attrition at each YCS has been removed[10], and

(3) the retention curve, which is a plot of survival to each YCS in turn; and

b. a retention by YOS spreadsheet, identical to the YCS spreadsheet above, using YOS data.

GRAPHICAL DATA PRESENTATION

21. From what has been outlined above, it is apparent that a great deal of tabular data was generated. To assimilate this mass of data for analysis it had to be presented in a more amenable manner, so a series of line and

---

[10] Where S_x = survival in year x
AR_{x+1} = attrition rate in the year after year x,
then
$S_{x+1} = S_x (1 - AR_{x+1})$

bar graphs was generated for selected commissioning plans, for officer ranks below Gen, and for specific MOCs and MOC groups.

22. All graphs generated in Harvard Graphics[11] (HG) from data within Lotus spreadsheets depict historical trends by juxtaposing yearly data. Four broad areas which conform to the major topics for analysis are depicted: commissioning plan representation, eligibility rates, promotion rates and retention. The graphs generated in HG were:

a. comparative commissioning plan representation graphs of trained effective strength including:

(1) line graphs depicting the strength for the minor commissioning plans of UTPM, CFR and 'others',

(2) line graphs depicting the strength for the major commissioning plans of ROTP, DEO and OCTP, and

(3) bar graphs depicting the strength distribution by commissioning plan of:

(a) total of all officers,

(b) junior officers, and

(c) senior officers;

b. comparative line graphs of commissioning plan eligibility rates (5-year moving averages) for each rank from Capt to LCol for:

(1) the major commissioning plans of ROTP, DEO and OCTP, and

(2) ROTP sub-divided by college type to compare CMC with civilian university;

---

[11] Harvard Graphics is a registered trademark of Software Publishing Corporation.

c. comparative HG line graphs of promotion rates (5-year moving averages) to each of the senior ranks by commissioning plan for:

(1) the major commissioning plans of ROTP, DEO and OCTP, and

(2) ROTP sub-divided by college type to compare CMC with civilian university; and

d. comparative commissioning plan line graphs of retention by YCS and YOS for:

(1) the minor commissioning plans of UTPM, CFR and 'others',

(2) the major commissioning plans of ROTP, DEO and OCTP,

(3) ROTP officers (those from CMC and civilian universities viewed separately), and

(4) civilian university commissioning plans (ROTP [just civilian university ROTP] and DEOD).

STATISTICAL TESTS

23. Data for all ranks and MOC groupings were submitted to a series of two-sided tests producing results at the 95 percent confidence level. Tests for the comparison of proportions were made to:

a. determine whether promotion rates (5-year moving averages) of officers from different commissioning plans were comparable; and

b. determine whether retention of officers from different commissioning plans was comparable.

24. To be able to perform the statistical tests noted above the number of officers (e.g. strength) in each rank cell needed to be larger than 30. In this study 5-year moving averages were used to increase cell size samples for promotion

rates. Where the promotion rate samples were still too small, statistical tests were performed on promotion rates averaged over all years.

25. For the results of statistical tests to be significant it is necessary that there be a small variation around the value of the statistic used. A small variation is generally obtained when the size of the sample being tested is large. When the sample size is small the variation could be large, and a large variation leads to an inconclusive outcome of the test.

SUMMARY

26. Although this outline seems to cover a lot of ground, it describes but a fraction of the information available. Policy issues and decisions require much more detail than mere static snapshots of the personnel situation. The composition of the officer corps within the CF today is a result of policies both past and current. To address major concerns a decision maker must have a good understanding of the way the population has evolved historically. The historical trend analysis that was used in this study provides the decision maker with that understanding.

ACCUMULATED RELEASE DATA

1. Retention data for this study were first obtained by an accumulation process using all past releases from the Military Personnel Information System (MPIS) release tape. In the analysis these data were compared against strength data to obtain release rates. A summary of accumulated releases is tabulated according to university type as outlined below:

a. Table A1-1: ROTP[1] - Accumulated Releases 78 - 92;

b. Table A1-2: DEOD[2] - Accumulated Releases 78 - 92;

c. Table A1-3: DEOP[3] - Accumulated Releases 78 - 92;

d. Table A1-4: DEO[4] - Accumulated Releases 78 - 92;

e. Table A1-5: UTPM[5] - Accumulated Releases 78 - 92;

f. Table A1-6: OCTPC[6] - Accumulated Releases 78 - 92;

g. Table A1-7: OCTPM[7] - Accumulated Releases 78 - 92;

h. Table A1-8: OCTP[8] - Accumulated Releases 78 - 92;

i. Table A1-9: CFR[9] - Accumulated Releases 78 - 92; and

j. Table A1-10: Other Commissioning Plans - Accumulated Releases 1978 - 1992.

Canadian Forces Personnel Applied Research Unit, Willowdale, Ontario

UNCLASSIFIED
SECURITY CLASSIFICATION OF FORM
(highest classification of Title, Abstract, Keywords)

DOCUMENT CONTROL DATA
(Security classification of title, body of abstract and indexing annotation must be entered when the overall document is classified)

1. ORIGINATOR (the name and address of the organization preparing the document. Organizations for whom the document was prepared e.g. Establishment Sponsoring a contractor's report, or tasking agency, are entered in Section 8).

Directorate of Manpower Analysis

2. SECURITY CLASSIFICATION
(overall security classification of the document, including special warning terms if applicable)

UNCLASSIFIED

3. TITLE (the complete document title as indicated on the title page. Its classification should be indicated by the appropriate abbreviation (S, C or U) in parentheses after the title)

An Examination of Officer Retention and Career Progression According to Different Commissioning Plans Within the Canadian Forces Volume I: Overall Results

4. AUTHORS (last name, first name, middle initial)

Bender, P., Chouinard, A., Lee, Capt A.D., Tanner, L., Tseng, S.

5. DATE OF PUBLICATION (month Year of Publication of document)

December 1993

6a. NO OF PAGES (total containing information. Include Annexes, Appendices, etc.)

105

6b. NO OF REFS (total cited in document)

5

7. DESCRIPTIVE NOTES (the category of document, e.g. technical report, technical note or memorandum. If appropriate, enter the type of report e.g. interim, progress, summary, annual or final. Give the inclusive dates when a specific reporting period is covered.)

Project Report

8. SPONSORING ACTIVITY (the name of the department project office or laboratory sponsoring the research and development. Include the address).

Ministerial Committee on the Canadian Military Colleges

9a. PROJECT OR GRANT NO. (if appropriate, the applicable research and development project or grant number under which the document was written. Please specify whether project or grant.)

9b. CONTRACT NO. (if appropriate, the applicable number under which the document was written.)

10a. ORIGINATOR's document number (the official document number by which the document is identified by the originating activity. This number must be unique to this document.)

Project Report 649

10b. OTHER DOCUMENT NOS. (Any other numbers which may be assigned this document either by the originator or by the sponsor.)

11. DOCUMENT AVAILABILITY (any limitations on further dissemination of the document, other than those imposed by security classification.)

(X) Unlimited distribution
( ) Distribution limited to defence departments and defence contractors: further distribution only as approved
( ) Distribution limited to defence departments and Canadian defence contractors; further distribution only as approved
( ) Distribution limited to government departments and agencies; further distribution only as approved
( ) Distribution limited to defence departments; further distribution only as approved
( ) Other (please specify):

12. DOCUMENT ANNOUNCEMENT (any limitation to the bibliographic announcement of this document. This will normally correspond to the Document Availability (11). However, where further distribution (beyond the audience specified in 11) is possible, a wider announcement audience may be selected.)

13. ABSTRACT (a brief and factual summary of the document. It may also appear elsewhere in the body of the document itself. It is highly desirable that the abstract of classified documents be unclassified. Each paragraph of the abstract shall begin with an indication of the security classification of the information in the paragraph (unless the document itself is unclassified) represented as (S), (C), or (U). It is not necessary to include here abstracts in both official languages unless the test is bilingual).

This Minister of National Defence created the "Committee on the Canadian Military Colleges" to examine the return on investment for the Canadian Forces (CF) of the Canadian Military College (CMC) system. The Directorate of Manpower Analysis was tasked to analyze officer career progression and retention in specific military occupations (MOCs) according to the commissioning plan by which the serving officer joined the regular force component.

This project report is broken into three volumes. Volume I contains the detailed analysis of CF officers as a whole followed by a discussion on the overall study results. Volume II contains the detailed analysis of each of the MOC groups examined, and Volume III contains the detailed analysis of each of the individual MOCs studied.

14. KEYWORDS, DESCRIPTORS or IDENTIFIERS (technically meaningful terms or short phrases that characterize a document and could be helpful in cataloguing the document. They should be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location may also be included. If possible keywords should be selected from a published thesaurus, e.g. Thesaurus of Engineering and Scientific Terms (TEST) and that thesaurus-identified . If it is not possible to select indexing terms which are Unclassified, the classification of each should be indicated as with the title.)

- Canadian Military Colleges
- career progression
