## THE AGRICULTURAL LAND CLASSIFICATION SYSTEM<sup>1</sup>

In the CLI classification system of land capability for agriculture, mineral soils are grouped into seven classes according to their potential and limitations for agricultural use. The most highly rated soils, those having no significant limitations for cropping, are designated Class 1. Soils with no agricultural potential are designated Class 7. Soils designated Classes 2 to 6 indicate, in declining order, capability for agriculture. A series of subclasses designate the specific nature of limitations inherent in each soil class. For organic soils, a separate category (0) was established. Summary descriptions of each agricultural capability class and subclass follow:

### CLASSES

- 1 SOILS IN THIS CLASS HAVE NO SIGNIFICANT LIMITATIONS IN USE FOR CROPS. The soils are deep, are well to imperfectly drained, hold moisture well, and in the virgin state are well supplied with plant nutrients. They can be managed and cropped without difficulty. Under good management they are moderately high to high in productivity for a wide range of field crops.
- 2 SOILS IN THIS CLASS HAVE MODERATE LIMITATIONS THAT RESTRICT THE RANGE OF CROPS OR REQUIRE MODERATE CONSERVATION PRACTICES. The soils are deep and hold moisture well. The limitations are moderate and the soils can be managed and cropped with little difficulty. Under good management they are moderately high to high in productivity for a fairly wide range of crops.
- 3 SOILS IN THIS CLASS HAVE MODERATELY SEVERE LIMITATIONS THAT RESTRICT THE RANGE OF CROPS OR REQUIRE SPECIAL CONSERVATION PRACTICES. The limitations are more severe than for Class 2 soils. They affect one or more of the following practices: timing and ease of tillage; planting and harvesting; choice of crops; and methods of conservation. Under good management they are fair to moderately high in productivity for a fair range of crops.
- 4 SOILS IN THIS CLASS HAVE SEVERE LIMITATIONS THAT RESTRICT THE RANGE OF CROPS OR REQUIRE SPECIAL CONSERVATION PRACTICES, OR BOTH. The limitations seriously affect one or more of the following practices: timing and ease of tillage; planting and harvesting; choice of crops; and methods of conservation. The soils are low to fair in productivity for a fair range of crops but may have high productivity for a specially adapted crop.
- 5 SOILS IN THIS CLASS HAVE VERY SEVERE LIMITATIONS THAT RESTRICT THEIR CAPABILITY TO PRODUCING PERENNIAL FORAGE CROPS, AND IMPROVEMENT PRACTICES ARE FEASIBLE. The limitations are so severe that the soils are not capable of use for sustained production of annual field crops. The soils are capable of producing native or tame species of perennial forage plants, and may be improved by use of farm machinery.

1 Abstracted from CLI Report No.2 - "Soil Capability Classification for Agriculture" 1972 Lands Directorate, Environment Canada

- 6 SOILS IN THIS CLASS ARE CAPABLE ONLY OF PRODUCING PERENNIAL FORAGE CROPS, AND IMPROVEMENT PRACTICES ARE NOT FEASIBLE.  
The soils provide some sustained grazing for farm animals, but the limitations are so severe that improvement by use of farm machinery is impractical. The terrain may be unsuitable for use of farm machinery, or the soils may not respond to improvement, or the grazing season may be very short.
- 7 SOILS IN THIS CLASS HAVE NO CAPABILITY FOR ARABLE CULTURE OR PERMANENT PASTURE.  
This class also includes rockland, other non-soil areas, and bodies of water too small to show on the maps.
- 0 ORGANIC SOILS.  
These soils are not placed in capability classes.

### SUBCLASSES

Subclasses are used to describe the types of limitations which restrict the potential of the soils. The nine subclasses used in the soil capability classification for agriculture are:

- C: Adverse climate - The main limitation is low temperature or low or poor distribution of rainfall during the cropping season, or a combination of these.
- E: Erosion damage - Past damage from erosion limits agricultural use of the land.
- I: Inundation - Flooding by streams or lakes limits agricultural uses of the land.
- P: Stoniness - Stones interfere with tillage, planting, and harvesting.
- R: Shallowness to solid bedrock - Solid bedrock is less than three feet from the surface.
- S: Adverse soil characteristics - Adverse characteristics include one or more of the following: undesirable structure, low permeability, a restricted rooting zone because of soil characteristics, low natural fertility, low moisture-holding capacity, salinity.
- T: Adverse topography - Either steepness or the pattern of slopes limits agricultural use.
- W: Excess water - Excess water other than from flooding limits use for agriculture. The excess water may be due to poor drainage a high water table, speepage or runoff from surrounding areas.
- X: Soils having a moderate limitation caused by the cumulative effect of two or more adverse characteristics which singly are not serious enough to affect the class rating.
