HEATING DEGREE-DAY NORMALS

BELOW 65°F - BASED ON THE PERIOD 1931-1960

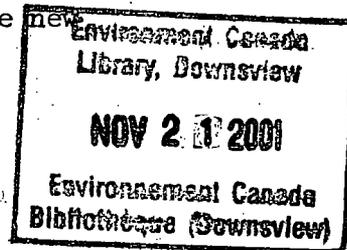

In Canada and the United States heating degree-days are most commonly based on a temperature of 65°F, which is applicable to the relative fuel consumption in homes and offices heated to a temperature of 70°F. One heating degree-day results for each degree that the daily mean temperature is below the base of 65°F. No degree-days are counted when the mean temperature is above 65°F. Heating degree-days to bases other than 65° are sometimes used in industry.

In 1956 the Meteorological Branch published CIR-2849 "Standard Period Heating Degree-Day Normals" which contained data from 250 locations in the country, calculated from normal temperature data based on the period 1921 to 1950. The heating degree-days listed in these data sheets are based on the new normal period from 1931 to 1960.

The new normal mean temperatures were prepared in the Climatology Division, and the monthly values of heating degree-days data were obtained using the National Research Council computer and a method devised by H.C.S. Thom of the United States Weather Bureau. Values are shown for all principal observing stations in the country with an appreciable length of record, and for those climatological stations with a particularly good homogeneous record over the period from 1931 to 1960. In addition to the degree-day data, a code number has been provided for each station indicating the manner in which the normal has been calculated. A key to this code is given at the end of the tables. To avoid confusion and the necessity of listing two values for February (for 28 and 29-day months), the February values are all based on a month of 28 1/4 days.

Values shown for Victoria Gonzales Heights, Winnipeg A, Toronto and Halifax are based on series of daily heating degree-days over the period 1931 to 1960.

This listing of heating degree-day values should be considered preliminary, and any errors or omissions should be brought to the attention of the office noted below. Within the next year it is planned to publish a booklet showing complete temperature normals and extremes over the 1931 to 1960 period which will include these heating degree-day normals.

Climatology Division,
Meteorological Branch,
315 Bloor Street West,
Toronto 5, Ontario.

October 30, 1964.

TYPE OF NORMAL

<u>CODE</u>	<u>DESCRIPTION</u>
1	Normals were computed directly from a period of record of 25 to 30 years within the period 1931 - 1960. In most cases the record existed over the full 30 years.
2	Same as Code 1, but not as much confidence has been placed in the data. These data were considered suspect, but the over all values are mapable.
3	The data for these normals were from the full ten-year period 1951 - 1960 adjusted to the standard normal period 1931 - 1960.
4	These averages are based on the complete ten years of record from 1951 to 1960. No adjustment factor was used.
5	These averages were obtained by taking a ten-year period of record, ending in the early 1960's. No adjustment factor was used.
6	These averages are based on the period of record of 10 to 24 years during the period 1931 to 1960. No adjustment factor has been used.
7	At several locations the observing station was moved from the town or city to an airport during the 1930's. At many of these locations the records were kept separate, but at those locations indicated by Code 7, the airport and town data were considered homogeneous. The resulting normals are based on the full 30-year period, from 1931 - 1960.
8	These data are based on the period of record of less than ten years.
9	These data are based on a period of record of less than ten years, but adjustments have been made when an unusually warm or cold month unduly influenced the average values.
